Associate Commissioner
(Data Processing)

Henry H. Philcox
Acting Assistant Commissioner
(Returns and Information Processing)

Fritz Scheuren
Director, Statistics of Income Division

The SOI Bulletin provides the earliest published annual financial statistics from various types of tax and information returns filed with the Internal Revenue Service. It also includes information from periodic or special analytical studies of particular interest to tax administrators. In addition, historical data are provided for selected types of taxpayers, as well as the gross internal revenue collections and other tax related items.

Information on the availability of additional unpublished data concerning the topics in this issue may be obtained by writing to the Statistics of Income Division, D:R:S, Internal Revenue Service, Washington, DC 20224.

In addition, special Statistics of Income tabulations based on income tax returns can be produced upon request on a reimbursable basis. Requests for this service should be addressed to the Director, Statistics of Income Division, at the address shown above.

Ralph B. Bristol, Jr., Chief, Tax Statistics, Office of Tax Analysis performed the overall policy review and provided comments. For this issue, he was assisted by Daniel J. Frisch and Geraldine Gerardi. Robert A. Wilson and Bettye Jamerson were the technical editors of the publication.

COMMISSIONER OF INTERNAL REVENUE

Washington, DC 20224

April 21, 1986

The Honorable James A. Baker, III
The Secretary of the Treasury
Washington, DC 20220

Dear Mr. Secretary:

I am transmitting the Spring 1986 issue of the Statistics of Income Bulletin. This report has been produced in accordance with the mandate of section 6108 of the Internal Revenue Code which requires the preparation and publication of statistics reasonably available with respect to the operation of the internal revenue laws. Presented in this issue are recent financial and tax data obtained from tax returns and associated supporting schedules.

With kind regards,

Sincerely,

A handwritten signature in black ink, appearing to read "Roscoe E. Eggen". The signature is written in a cursive style with a large, sweeping flourish at the end.

Articles in Preparation for Upcoming Issues

- Taxpayer Usage of Forms 1040, 1040A and 1040EZ, 1985
- Sole Proprietorship Returns, 1984
- Partnership Returns, 1984
- Controlled Foreign Corporations by Industry, 1983
- U.S. Possessions Corporations, 1985
- Estates, 1982-84

NOTE TO USERS: Please take time to complete the survey form at the back of this publication. No postage or envelope is required. Your input will help us to be more responsive to the information needs of our users. Thank you for your cooperation.

Contents

	Page
New SOI Statistical Services, 1985-86 By Bettye Jamerson A description of a series of new statistical services introduced by the SOI Division beginning in 1985 is provided. Information on SOI projects and primary contacts are also included.	1
Foreign Tax Credit by Industry, 1982 By Mary E. Barlow For 1982, U.S. corporations with overseas operations credited \$18.9 billion of foreign income taxes against \$86.8 billion of U.S. income taxes.	9
High-Income Returns, 1983 By Allen H. Lerman For 1983, there were 198,608 tax returns with AGI of \$200,000 or more. Of these, 447 reported no U.S. income tax, and 321 had no worldwide tax liability.	31
An Analysis of Partnership Activity, 1981-83 By Lowell Dworin A closer analysis of recent partnership statistics shows that after certain adjustments are made for income and expenses not includable in partnership net income, a more complete picture of the im- pact of tax shelter activities is revealed.	63
Environmental Taxes, 1981-84 By Rashida Belal Through December 1984, a total of \$978 million in environmental excise taxes was reported for the funds established under the Comprehensive Environmental Response, Compensation and Liability Act of 1980. Of this amount, \$644 million was for petrochemicals.	75
More Preliminary Individual Income Statistics, 1984 By David Barker and Marshall Epstein A continuation of the preliminary individual income tax returns statistics for 1984 published in the Winter 1985-86 issue of the SOI Bulletin, the data show that itemized deductions for interest and taxes paid each increased by more than 15 percent over 1983.	83
Crude Oil Windfall Profit Tax, Second Quarter 1985 By Edward Chung For the second quarter of 1985, the number of barrels of domestically-produced crude oil subject to the windfall profit tax was 474 thousand, down from 614 thousand the quarter before. As a result, the tax continued its long decline, from \$1.7 million to \$1.5 million.	89

New SOI Statistical Services, 1985-86

By Bettye Jamerson*

The mission of the Statistics of Income (SOI) Division is to compile and publish statistical data about Federal tax laws (as required by section 6108 of the Internal Revenue Code). The SOI program provides annual financial and tax data obtained from the principal tax returns, as well as more detailed data (usually periodic) from supplemental schedules and other tax returns.

Beginning in 1985 the SOI Division introduced a series of new statistical services. This article describes the new statistical services, publications, and other continuing services available. Information on SOI projects and primary contacts are also included.

More detailed information on these statistical services than is described below can be obtained by writing to the Director, Statistics of Income Division, Internal Revenue Service, 1111 Constitution Ave., N.W., Washington, D.C. 20224.

NEW STATISTICAL SERVICES

As mentioned above, the SOI Division has introduced several new statistical services. These tailored services are in response to numerous requests for more detailed and previously unpublished information tabulated from U.S. income tax returns filed by corporations, individuals, estates, and others.

International Income and Taxes

Subscribers to this service will receive a copy of a 516 page report, Compendium of Studies of International Income and Taxes, 1979-83, (Publication 1267) and information on 13 international studies as it becomes available [1].

These studies deal mostly with the foreign activity of U.S. corporations, the U.S. activity of foreign corporations, and the worldwide activity of U.S. corporations owned by foreign interests. Other studies deal with U.S. possessions corporations, international boycott participation, foreign trusts, non-resident alien estates, nonresident alien income and tax withheld, and certain foreign activities of U.S. individuals. Some studies are conducted annually, while others are conducted every 2 to 4 years.

The price of this service is \$45. It includes Publication 1267 and additional information for a year, as it becomes available. In addition to new material, the Compendium contains information previously available only in several separate publications. The 1-year period for receiving additional information can be extended at a cost of \$35 for each additional year. A long-term subscription (\$150) includes Publication 1267 and additional information as it becomes available through August 1990. The next Compendium is scheduled for release in September 1990.

The primary contact person for information regarding this service is Jim Hobbs (202) 376-0177.

Individual Income Taxes

Subscribers to this service will receive a copy of Individual Income Tax Returns, 1983, which contains final tabulations for 1983. Preliminary information on 1984 and 1985 returns will also be provided as part of this service.

*Coordination and Publications Staff. Prepared under the direction of Robert Wilson, Team Leader.

The 1983 information is contained in a 115 page report presenting data on returns filed, sources of income, adjusted gross income (AGI), exemptions, itemized deductions, and tax computations. A brief text highlights the requirements for filing, changes in law, and limitations of the data. In addition, definitions of terms used in the tabulations and copies of tax forms are also included.

Preliminary 1984 and 1985 information will be provided to subscribers as it becomes available throughout the year. Subscriptions are \$20 per year.

Individual Tax Model Files are also available from the SOI Division [2]. These microdata files consist of detailed information taken from a systematic, stratified sample of actual individual tax returns, edited, however, to prevent identification of individual taxpayers. The primary uses made of these Files have been to simulate the administrative and revenue impact of tax law changes, as well as to provide general statistical tabulations relating to sources of income, itemized deductions, and taxes reported by individuals.

The price of the 1983 Tax Model File is \$2,150. General description booklets for the Tax Model Files for 1983 and prior years are available without charge from the SOI Division.

The primary contact person for information regarding the individual income tax return statistical service is Susan Hostetter (202) 376-0083. Information regarding the Tax Model Files is available from Peter Sailer (202) 376-0081.

Partnership Returns

Subscribers to this service will receive a 314 page report presenting previously unpublished data for 1980, 1981, and 1982 (as well as data previously issued in other publications), a discussion of historical trends on partnerships, and an article on partnership employment and payroll for 1979. Data for each year are classified by industry, number of partners, and the state in which the partnership is located. Other tables contain detailed data on partnership balance sheets, data on limited partnerships, and data classified by size of total assets.

Subscribers to this service also will be provided with updated information for 1983 and 1984 when it becomes available and will also be notified of future statistical releases relating to partnership returns. The cost of

the service is \$22 per year. The primary contact person for information regarding this service is Tom Petska (202) 376-0761.

Tax-Exempt Organizations

Subscribers to this service will receive a copy of a compendium on tax-exempt organizations that is being prepared and will be available in the fall of 1987. It will contain reprints of all articles and research papers published on these topics (enhanced by a more detailed analysis of quality and nonsampling issues, reprints of tax forms, more specialized tables, and an explanation of terms). Future compendiums will be released every 5 years.

Subscribers to this service also will be provided with updated information on exempt organizations as it becomes available. Subscriptions are \$35 per year. The primary contact person for information regarding this service is Mike Alexander (202) 376-0199.

Small-Area Data

This service includes data on number of individual income tax returns, exemptions, and AGI, presented by state, county, and Standard Metropolitan Statistical Area (SMSA), as well as information on persons who moved from one location to another based on addresses reported on the returns. Tabulations available are:

- "County Migration Flow Data" for Calendar Years 1978-80, 1980-81, 1981-82, 1982-83, and 1983-84 which show for each county both from what county in-migrants moved and to what county out-migrants moved. Tapes for the entire country are available at a cost of \$120 for each of the time periods indicated above.
- "County Migration Data" for Calendar Years 1980-82 and 1982-83, which show the number of in-migrants, out-migrants, and nonmigrants. Tapes for the entire country are available at a cost of \$75.
- "County Income Data" for Tax Year 1982, which provides AGI, wages and salaries, interest, dividends, and rents for each county as well as the number of returns and exemptions. A tape for the entire country is available for \$120.

The primary contact person for information regarding this service is Peter Sailer (202) 376-0081.

BUSINESS SOURCE BOOKS

The SOI Division offers three "source books." In addition to the Corporation Source Book, two new products have been developed, one for partnerships and the other for sole proprietorships.

Corporation Source Book, 1926-82

The Corporation Source Book provides detailed industry data for active corporations. For most years through 1982, it contains income statement and balance sheet data categorized by more detailed industry groups than are used in the published SOI and also by size of total assets.

For 1982, the 481 page Source Book (Publication 1053) is available for \$175. Microfilm (35-mm) covering all industries are also available at \$175. A magnetic tape containing the tabular statistics for 1982 can be purchased for \$1,500.

Corporation Source Books for years before 1982 are also available from the SOI Division. A more comprehensive description of the annual Source Book, which includes lists of the industry groups used for these years, and information on how to obtain single-industry data is available without charge from the SOI Division. Pricing information is also included [2].

The primary contact person for information regarding the Corporation Source Book is Karen Cys (202) 376-0102.

Partnership Source Book, 1957-83

This Source Book shows key partnership data for 1957 through 1983, by detailed industry groupings. It includes a historical definition of terms and legislative changes affecting partnerships during that period. Purchasers of this service will also be advised of the release of subsequent years' data.

Subscriptions are \$30 per year. A magnetic tape containing the tabular statistics can be purchased for \$200. The primary contact person for information regarding this Source Book is Tom Petska (202) 376-0761.

Sole Proprietorship Source Book, 1957-84

The Sole Proprietorship Source Book is being prepared and will be available later in 1986. It is a companion to that for partnerships and will include data on number of returns; business receipts; interest paid, depreciation and taxes-paid deductions; payroll; and net income.

Subscription price will be announced. As with partnerships, there will also be a magnetic tape version. The primary contact person for information regarding this Source Book is Peter Sailer (202) 376-0081.

OTHER PUBLICATIONS AND SERVICES [3]

The Statistics of Income (SOI) Bulletin (Quarterly) -- Publication No. 1136 - Subscription price, \$20; single-copy price, \$5.50.

The SOI Bulletin provides the earliest published financial statistics from the various types of tax and information returns filed with the Internal Revenue Service. The Bulletin also includes information from periodic or special analytical studies of particular interest to tax administrators and economists.

Statistics of Income--1982, Corporation Income Tax Returns, Publication No. 16 -- Price \$6.

This report contains detailed information on receipts, deductions, net income, income tax liability, tax credits, and distributions to stockholders. Information is classified by industry and size of total assets or business receipts.

Other Services

(Prices depend on requests)

Unpublished tabulations based on SOI data are also available. Prices depend on the nature of the request. Included are detailed tables underlying those published in the SOI Bulletin as well as in other SOI publications.

Special tabulations also can be specifically produced to a particular user's specifications. Some recent special tabulations that have been produced to fulfill requests from various organizations are special tabulations on average deductions requested by a private accounting firm; sole proprietorship data by sex for the Small Business Administration, Office of Women's Business Ownership; and individual income tax return data on contract construction workers for another private accounting firm.

NOTES AND REFERENCES

- [1] SOI published reports offered as part of the statistical services in some instances may be purchased individually from the Superintendent of Documents, U.S. Government Printing Office.
- [2] Magnetic tapes of the Individual Tax Model Files for 1966-78 and Corporation Source Book Files for years 1965-79 are available for purchase through the Machine-Readable Archives Branch of the National Archives and Records Service, Washington, D.C. 20408.
- [3] Available for purchase from Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

CORPORATION STATISTICS BRANCH
PROJECTS AND PRIMARY CONTACTS

Project	Frequency	Primary Contacts Area Code (202)	Comments
Corporation Income Tax Returns: 1983 Program 1984 Program 1985 Program	Annual	Victor Rehula (376-0102) David Jordan (376-0102) Tim Wheeler (376-0102)	Basic SOI program covering complete income statement, balance sheet, tax and tax credits, and distributions to stockholders, and details from supporting schedules.
Partnership Returns of Income	Annual	Alan Zempel (376-0761)	Basic SOI program covering income statement, balance sheet, and details from supporting schedules.
Secretary's Percentage Study	Annual	Joe Middough (376-0061)	Data for computation of percentage used in determining income tax liability of foreign life insurance companies with operations in the United States.
Employment Tax Return Studies: Unincorporated Businesses Corporations	Periodic, based on availability of outside funding	Charles Day (376-0761) Bill Gerber (376-0761)	Addition of payroll and employment data to SOI files of corporations, partnerships and sole proprietorships based on linkages with employment tax returns, Forms 941 and 943. Last completed study was for Tax Year 1979.
Partnership Geo-Coding Study	Periodic, based on availability of outside funding	Charles Day (376-0761)	Addition of (Census) geographic code to IRS Master File records of partnership returns for use in tabulations classified by state, county and industry. Last completed study was for Tax Year 1983.
Census-IRS Link Study	Every 5 years	Bertie Brame (376-0762)	A by-product of data provided by IRS for the Economic Census, project involves linking business returns of partnerships and Small Business Corporations to the income tax returns of selected partners and shareholders. The last completed study was for Tax Year 1982.
Partnership Schedule K/K-1 Study	Periodic, based on availability of outside funding	Alan Zempel (376-0761)	An examination of the recognized "gap" between income reported by the partnership and income reported by the partners through a link of Schedules K and K-1 to Forms 1065. Study for 1983 is underway.
Tax Shelter Registration Study	Not yet determined	Tom Petska (376-0761)	The development of a file of Forms 8264, Application for Registration of a Tax Shelter, which will eventually be matched to partnership return data for analysis of "tax shelter" characteristics.
Statistical Subscription Series: Corporation Source Book Partnership Source Book	Annual	Sandy Byberg (376-0102) Gail Moglen (376-0761)	Detailed industry data and other information for sale.

FOREIGN STATISTICS BRANCH (DOMESTIC STUDIES)
PROJECTS AND PRIMARY CONTACTS

Project	Frequency	Primary Contacts Area Code (202)	Comments
Private Foundations	Annual	Peggy Riley (376-0199)	Net worth and various data from the balance sheet and income statement. The sample is longitudinal in design so that essentially the same organizations are observed over time. The last complete study was for 1982.
Other Exempt Organizations	Annual	Cecelia Hilgert (376-0199)	Net worth and various data from the balance sheet and income statement for only those organizations classified as tax exempt under subsection 501(c)(3) of the Internal Revenue Code. The groups covered are religious, educational, scientific, and literary (excluding private foundations). The sample is longitudinal in design so that essentially the same organizations are observed over time. The last complete study was for 1982.
Farmers' Cooperatives	Periodic, based on availability of outside funding	Mike Alexander (376-0199)	The next farmers' cooperative study is planned to coincide with the 1987 Economic Census. The last complete study was for Tax Year 1977.
Estates	Annual	Marvin Schwartz (376-0199) Kathy Medve (376-0199) John Kozielec (376-0199)	Gross estate and its composition, deductions, and tax. Also included is information on the age, sex, and marital status of the decedents. Basic estate tax return data by year in which returns are filed are produced every year. Other statistics are available on a year-of-death basis (approximately every 3 years). The last complete estate study was for returns filed in 1984.
Personal Wealth	Periodic	Marvin Schwartz (376-0199) Kathy Medve (376-0199)	Estimates of personal wealth are generated based on estate tax return data using the "estate multiplier" technique, using both the filing year and year-of-death estate data bases. The most recent data available are based on returns filed in 1983. Complete data based on individuals who died in 1982 will be available in the summer of 1986.
Estate Collation	Periodic	Marvin Schwartz (376-0199)	Studies link estate data for decedents and beneficiaries. Income information for beneficiaries is available both for years preceding and following the decedent's death. Information on gift tax returns is available for the last 2 years of the decedent's life. The most recent study is based on decedents who died in 1982.
Intergenerational Wealth	One time	Marvin Schwartz (376-0199)	This study, which involves estate returns filed since the inception of that tax (1916), focuses on the changes in the concentration of wealth and the intergenerational transfer of wealth, as well as the history of the estate tax system. The asset composition, available demographic information, and an analysis of beneficiaries of the estates will be emphasized. Information from the first phase of this study (1916-35) will be available in fall 1986.
Fiduciary	Annual	John Kozielec (376-0199)	The next full-scale fiduciary study will cover data on income, deductions, and taxes for 1989. The last complete study was for Tax Year 1982.

FOREIGN STATISTICS BRANCH (FOREIGN STUDIES)
PROJECTS AND PRIMARY CONTACTS

Project	Frequency	Primary Contacts Area Code (202)	Comments
Corporation Foreign Tax Credit: 1982 Program 1984 Program	Biennial	Chris Carson (376-0177) Vergie Mose (376-0177)	Foreign income and taxes paid, and foreign tax credit shown on corporation income tax returns. Data are classified by industry and country.
Controlled Foreign Corporations/Foreign Corporations: 1982 Program (CFC) 1984 Program (FC)	Biennial	Bill States (376-0177) Jeff Hartzok (376-0177)	Activities of corporations which are controlled by U.S. corporations. Data are classified by industry and country.
U.S. Possessions Corporations (1983)	Biennial	Jeff Hartzok (376-0177)	Income statement, balance sheet, tax and possessions tax credit data for "qualifying" U.S. possessions corporations. (Most of these corporations are located in Puerto Rico.)
International Boycott Participation (1984)	Annual	Vergie Mose (376-0177)	Business operations of U.S. persons in boycotting countries, as well as the requests and agreements to participate in, or cooperate with, international boycotts not sanctioned by the U.S. Government.
Nonresident Alien Income and Tax Withheld (1984)	Annual	Maggie Lewis (376-0177) Chris Carson (376-0177)	U.S. source income paid to nonresident aliens and the amount of tax withheld for the U.S. Government.
Domestic International Sales Corporations (1984)	Annual, through 1984	Art Gianelos (376-0177)	Balance sheet, income statement, distributions, and export gross receipt data for DISC's. (These corporations were given special tax treatment to promote U.S. exports.)
Interest Charge Domestic International Sales Corporations (IC-DISC): 1984 Program 1985 Program	Annual, beginning with 1984	Art Gianelos (376-0177) Bill States (376-0177)	These corporations replaced the DISC (see above), as of January 1, 1985. Balance sheet, income statement, export-related data will be tabulated.
Foreign Sales Corporations (FSC): 1984 Program 1985 Program	Annual, beginning with 1984	Art Gianelos (376-0177) Chris Carson (376-0177)	These corporations replaced the DISC (see above), as of January 1, 1985. Balance sheet, income statement, and export-related data will be tabulated.
Foreign Trusts (1986)	Every 4 years	Bill Sutton (376-0177)	Foreign trusts that have U.S. persons as grantors, transferors, or beneficiaries. Data include country where trust was created, value of transfer to the trusts, and when trust was created.
Nonresident Alien Estates (1986)	Every 4 years	Bill Sutton (376-0177)	Estates of nonresident aliens who have more than \$60,000 of assets in the United States. The estates are subject to U.S. estate taxation on the U.S. property.
Sales of U.S. Real Property Interests by Foreign Persons (1985)	Annual, beginning with 1985	Mary Barlow (376-0177)	Transfers of U.S. real property interests, when these interests are acquired from foreign persons. Data will include amount realized on the transfer, amount of U.S. tax withheld, and country of foreign person.

INDIVIDUAL STATISTICS BRANCH
PROJECTS AND PRIMARY CONTACTS

Project	Frequency	Primary Contacts Area Code (202)	Comments
Individual Income Tax Returns: 1984 Program 1985 Program	Annual	Terry Smith (376-0083) David Barker (376-0083)	Basic SOI program covering income, deductions, credits, and taxes reported on individual income tax returns and associated schedules.
Sole Proprietors: 1984 Program 1985 Program	Annual	Ray Wolfe (376-0083)	Basic SOI program covering the same data provided in the Individual SOI program plus detailed data on business receipts, deductions, and net income reported on Schedule C. Similar data from Schedule F (for farmers) are available every 5 years beginning with 1982.
Taxpayer Usage Study	Annual	Lisa Gross (376-0081)	Basic SOI program providing frequencies of specific line entries made by taxpayers, the use of various return schedules and associated forms, as well as general characteristics of the individual taxpayer population. Weekly reports are produced during the primary filing season (January through April).
Tax Models	Annual	Michael Strudler (376-0104)	Microdata files consisting of detailed information obtained from the Individual SOI program with identifiable information omitted to make the file available for public dissemination. In addition to microdata files, specific tabulations are produced on a reimbursable basis.
Sales of Capital Assets 1985 Program 1983-87 Panel Study	Every 4 years	Marshall Epstein (376-0083)	Basic SOI program covering the same data provided in the Individual SOI program plus detailed data focused on the sales of capital assets reported on Schedule D, plus sales of residences, sales of personal or business depreciable property, and the computation of installment sale income reported on other return schedules. The 1985 study is now beginning. Results from the 1981 study have been published. The panel study provides the same data on capital asset transactions for a subsample of the returns in the Sales of Capital Assets basic study; however, data for these taxpayers are obtained over a 5-year period.
Americans Living Aboard	Every 4 years	Dan Holik (376-0083)	Basic SOI program covering the same data provided in the Individual SOI program, plus detailed data on foreign earned income and foreign tax credit.
Individual Matching Studies	As requested	Barry Windheim (376-0081) Charles Crossed (376-0081)	Obtaining IRS Master File data for income, deductions, credits, and taxes for selected groups of taxpayers specified by the sponsor. Requests range from a stripoff of the entire Master File for the Bureau of the Census (as authorized by law) to a tabulation of the data based on specific social security numbers as requested by the Veterans Administration. Unless permitted by law, only tabular output is provided because of disclosure concerns.
Occupation Studies	Periodic, based on availability of outside funding	Patricia Crabbe (376-0104)	A series of studies designed to classify individual income tax returns by occupation and to develop a dictionary of occupation titles that can be used to enhance the economic data of many other studies.
Small-Area Data	Periodic, based on availability of outside funding	Gary Estep (376-0104) Bobby Clark (376-0081)	The development of a program to provide selected tax return information obtained from the IRS Master File system at the county or ZIP Code level. In addition, program provides migration flow data by county.

Foreign Tax Credit by Industry, 1982

By Mary Barlow*

The foreign tax credit claimed by corporations declined for the third consecutive year, to \$18.9 billion for 1982 [1]. Many corporations suffered foreign or domestic losses in this year and, therefore, were unable to claim a foreign tax credit. Because of this reduction in foreign income, less tax was paid to foreign countries. These factors resulted in a \$2.9 billion decline in credit from 1981. While the foreign tax credit reached an all-time high of nearly \$37 billion for 1979, not since 1973 has the credit been under \$19 billion.

Although 1.2 million corporations had a U.S. tax obligation for 1982, only 4,941, or 0.4 percent, claimed a credit for foreign taxes [2]. This compares to 6,132 corporations that claimed a foreign tax credit for 1981. While only 38 percent of all corporations claiming a credit were in manufacturing, these corporations accounted for 78 percent of the total credit. Corporations engaged in integrated petroleum activities (i.e., extracting, refining, and also marketing petroleum products) represented a considerable portion (39 percent) of the total credit claimed for 1982.

Foreign-source interest income (excluding interest from foreign branches) rose by nearly 80 percent from 1980 for all corporations that claimed a foreign tax credit [3]. While interest income increased from \$12.5 billion in 1980 to nearly \$22.5 billion in 1982, nearly all of that increase was attributable to the banking industry [4]. During this period, foreign non-branch interest income in the banking industry more than doubled to \$16.6 billion, largely a reflection of high interest rates and increased lending.

Nearly one-fourth (\$14.6 billion) of total foreign-source taxable income for 1982 was earned by unincorporated foreign branches of U.S. corporations. This income played a significant role in the banking industry, as 67 percent of foreign taxable banking income was attributable to foreign branches. In contrast, manufacturing and wholesale and

retail companies were more likely than corporations in other industries to operate through foreign subsidiary corporations. This is evidenced by the high percentage of dividend income (including dividend gross-up) earned by companies in these industries (48 percent and 47 percent of gross income, respectively).

In general, foreign effective tax rates were higher on foreign-source taxable income of U.S. corporations than the U.S. effective tax rate [5]. While this was true on an overall basis, rates varied considerably by industry. The petroleum industry (including both integrated and extracting oil companies) had by far the highest effective foreign tax rate, as shown in the following table. Conversely, the banking industry's effective foreign tax rate was only one-third of the corresponding U.S. rate. This was mainly attributable to low or zero foreign withholding tax rates on interest, which made up 90 percent of non-branch banking gross income. The effective foreign tax rate for all other industries approximated the U.S. rate.

Industry	Effective foreign tax rate	Effective U.S. tax rate
All industries....	38.3%	35.5%
Petroleum.....	60.1	38.7
Banking.....	12.7	38.4
Other.....	32.3	34.1

BACKGROUND

Prior to 1918, U.S. corporations could deduct foreign taxes from their worldwide gross income to determine their income subject to U.S. tax. Not until World War I, when the economic climate of the United States and abroad changed dramatically, did the need for new legislation begin to emerge. U.S. foreign trade experienced new growth and tax rates both in the United States and overseas rose quickly. The U.S. income tax on

*Foreign Returns Analysis Section. Prepared under the direction of James Hobbs, Chief.

foreign-source income combined with the taxes imposed on U.S. corporations by foreign countries generally made for a very high effective tax rate on foreign income. This double taxation provided little incentive for U.S. corporations to establish overseas operations. In 1918, Congress enacted legislation allowing U.S. corporations a dollar-for-dollar credit for foreign taxes paid on foreign income, excess profits, and war profits. Essentially, the credit reduced the U.S. income tax liability by the amount of foreign tax paid or accrued on foreign income. While many modifications to the foreign tax credit have been made since then, the underlying framework remains intact [6].

Before passage of the Revenue Act of 1921, U.S. corporations were unlimited in the amount of foreign taxes they could credit. As a result, many corporations used the foreign tax credit mechanism to offset their income tax liability on domestic, as well as on foreign, income since foreign taxes in excess of the U.S. rate could be credited without limitation. To remedy this situation, the 1921 act imposed a limitation on foreign tax credits.

Currently, corporations are subject to a limitation in which the credit can not be greater than that percentage of total U.S. income tax that foreign-source taxable income (but not in excess of worldwide taxable income) is of worldwide taxable income [7]. This calculation results in a limitation of zero if a corporation has an overall foreign loss. In addition, corporations with worldwide losses would have no U.S. tax against which to claim a credit. For 1982, this limitation had to be separately calculated for four categories of income: (1) section 904(d) (passive) interest income, (2) dividends from a Domestic International Sales Corporation (DISC) or former DISC, (3) foreign oil-related income, and (4) all other income from foreign sources. Any foreign tax paid or accrued or deemed paid (see "Current-year foreign taxes" in the Explanation of Selected Terms Section) in excess of the limitation could be carried back two years and then brought forward five years, provided that these taxes do not exceed the limitation for those years.

To claim a foreign tax credit, a U.S. corporation must have foreign-source taxable income, pay foreign income tax on the foreign income, and have a U.S. income tax liability. As previously stated, only certain taxes are creditable. These include taxes imposed by U.S. possessions or the national government of a foreign country, as well as its cities, states, and other subdivisions. Taxes such as excise, franchise, sales, etc., do not qualify as creditable foreign taxes, but can be

deducted in calculating worldwide taxable income.

Since U.S. corporations are taxed on their worldwide income, the foreign tax credit serves to eliminate double taxation. While foreign taxes may be treated as a deduction, corporations almost always benefit more by crediting these taxes, as is shown in Figure A.

Note that by crediting the foreign taxes rather than deducting them, the "total tax" figure is significantly reduced, yielding a larger income after tax. While the effective worldwide tax rate on worldwide income is approximately 58 percent if the deduction method is used, the effective tax rate is reduced to about 46 percent by opting for the credit (assuming the foreign tax rate equals the U.S. rate). Furthermore, the corresponding effective U.S. tax rate on foreign-source income is virtually zero by crediting foreign taxes, and about 25 percent using the deduction.

FOREIGN INCOME, TAXES, AND CREDIT, BY INDUSTRY

The foreign tax credit decreased 12 percent from 1980 to 1981 and another 13 percent for 1982. The following table depicts the foreign tax credit by industrial division and the changes in the credit from 1980 to 1982.

Foreign Tax Credit by Industrial Division, 1980 and 1982

[Money amounts in millions]

Industrial division	1980	1982	Percent- age change
	(1)	(2)	(3)
All industries	\$24,880	\$18,932	- 23.9%
Agriculture, forest- ry, and fishing.....	7	2	- 74.6
Mining.....	1,964	1,610	- 18.0
Construction.....	151	175	16.1
Manufacturing.....	19,192	14,775	- 23.0
Transportation and public utilities....	462	255	- 44.9
Wholesale and retail trade.....	1,525	436	- 71.4
Finance, insurance, and real estate.....	1,397	1,458	4.4
Services.....	181	220	21.4

While the foreign tax credit fell nearly 24 percent for all industries, the most significant decrease was the \$4.4 billion reduction in credit claimed by companies in the manufacturing industry. The 23 percent drop in the credit for this industry accounted for nearly three-fourths of the total reduction between 1980 and 1982.

Figure A

A Comparative Example of Foreign Tax Treatment: Credit Versus Deduction

Item	Foreign tax credit	Deduction for foreign taxes
1. Worldwide taxable income	\$20,000,000	\$20,000,000
a. Domestic	10,000,000	10,000,000
b. Foreign (before foreign tax deduction)	10,000,000	10,000,000
2. Foreign taxes	4,580,250	4,580,250
3. Foreign income subject to U.S. tax	10,000,000	5,419,750
4. Total income subject to U.S. tax (line 1a + line 3)	20,000,000	15,419,750
5. U.S. tax before credits	9,180,250	7,086,635
a. On domestic income	4,580,250	4,580,250
b. On foreign income	4,600,000	2,506,385
6. Foreign tax credit	4,580,250	—
7. U.S. tax after credits (line 5 - line 6)	4,600,000	7,086,635
8. Total tax (line 2 + line 7)	9,180,250	11,666,885
9. Net income after total tax (line 1 - line 8)	10,819,750	8,333,115
10. Effective worldwide tax rate (line 8 ÷ line 1)	45.9%	58.3%
11. Effective U.S. tax rate on foreign income ((line 7 - line 5a) ÷ line 1b)	0.2%	25.1%

NOTE: Deducting foreign taxes is preferable to crediting only when less than 46 percent of current-year taxes can be credited for the current year, or be used as either a carryback or carryforward credit to other years.

Several other industrial divisions experienced dramatic decreases (in percentage terms) in the credit, as shown. The impact that these smaller industries had on the total foreign tax credit claimed, however, was not significant. In contrast, three industrial divisions showed an increase in the credit claimed, the most substantial being in finance, insurance, and real estate. Specifically, banking exhibited the greatest change (to \$1.2 billion), an increase of 10 percent since 1980.

Dominance of the Petroleum Industry

While the number of corporations in the petroleum industry was a small portion of the total number of corporations claiming a foreign tax credit, these companies constituted a significant share of foreign income, taxes, and

credit. Figure B illustrates the sizeable foreign presence of corporations engaged in integrated petroleum activities and oil and gas extraction operations.

It is interesting to note that petroleum companies represented 3 percent of all corporations claiming a foreign tax credit, but claimed nearly half of the total foreign tax credit. Also noteworthy is the fact that these companies accounted for 34 percent of foreign-source taxable income, but 54 percent of total current-year foreign taxes. The petroleum industry's effective foreign tax rate on this foreign taxable income averaged 60 percent [8].

Explanation of Selected Terms Section) accounted for 29 percent of worldwide taxable income for all corporations for 1982. This ratio remained unchanged from 1980, as both foreign and worldwide income decreased approximately 16 percent, to \$59.5 billion and \$205.2 billion, respectively. The \$41.4 billion reduction in worldwide taxable income was partially due to the 49 percent increase in interest expense [9]. Several industrial divisions experienced a reduction in foreign income, yet losses sustained by the manufacturing industries were the most substantial. Within this industrial division, corporations primarily engaged in integrated petroleum activities accounted for 71 percent of the total \$11.1 billion reduction in foreign income.

Current-year foreign taxes for U.S. corporations claiming a credit fell 24 percent from 1980, a \$7.2 billion difference. Manufacturers engaged in integrated petroleum activities experienced a 28 percent decrease in these taxes compared to 1980, closely approximating the 32 percent decrease in their foreign taxable income. This industry was still responsible for \$10.2 billion or 45 percent of the total \$22.8 billion of current-year foreign taxes that qualified for the 1982 credit.

Foreign taxes in the banking industry rose by 31 percent from 1980 to 1982, to \$1.4 billion. In contrast, foreign banking taxable income rose a modest 9 percent, while gross income and deductions more than doubled. The tax increase exceeded the rise in taxable income because most foreign withholding taxes are imposed on gross, rather than taxable (net), income.

If foreign tax rates were the same as the U.S. rate, it would follow that the ratio of foreign-source taxable income to worldwide

taxable income should approximate the ratio of current-year foreign taxes to U.S. income tax after credits (excluding the foreign tax credit). Figure C suggests that foreign tax rates on an overall basis are slightly higher than the U.S. tax rate, since the foreign tax ratio (34.5 percent) is higher than the foreign income ratio (29.0 percent) [10]. Although the finance, insurance, and real estate industrial division had a high foreign-source taxable income relative to its worldwide taxable income (60.8 percent), its foreign taxes were only 24.1 percent as great as its U.S. income tax liability. Low foreign withholding rates on banking income (primarily interest) were responsible for the low effective foreign tax rate for the finance division.

In contrast, about one half of taxable income generated in mining was foreign earned, but foreign taxes were nearly 80 percent as great as U.S. income tax after credits (excluding foreign tax credit). The large foreign tax liability for mining was due to the high tax rates associated with oil and gas extraction income. Manufacturing industries also had a large foreign tax liability, with foreign taxes amounting to nearly half of the amount the United States would have levied on worldwide income, although only 38.5 percent of this industry's income was from foreign sources.

Foreign Gross Income and Taxes

Corporations with foreign business activity can operate by using a variety of business structures or methods. These include:

- unincorporated foreign branches--income reported as branch taxable income;
- controlled foreign corporations [11] --income reported as dividends and

Figure C
Foreign-Source Taxable Income as a Percentage of Worldwide Taxable Income and Current-Year Foreign Taxes as a Percentage of U.S. Tax after Credits (Excluding the Foreign Tax Credit), by Industrial Division, 1982

Note: The amounts of worldwide taxable income and U.S. income tax after credits (excluding foreign tax credit) used in these calculations represent all corporations rather than those with foreign tax credit. These percentages are estimates, as a small amount of foreign income and tax data are not included in these statistics (see the Data Sources and Limitations section of this article).

- dividend gross-up; and
- direct transactions with a foreign corporation (whether controlled or not) or unrelated entities--gross income of other types, for example interest, rents, royalties, and services income.

Corporations that operated through foreign branches are discussed in the section "Branch Income." The following discussion describes the income and taxes associated with alternative business structures.

Total foreign gross income remained virtually the same as 1980; however, significant changes occurred in its composition. Interest surpassed dividends and rents (including royalties and license fees) as the most common type of foreign income (see Figure D). Interest income other

than from foreign branches rose dramatically from \$12.5 billion for 1980 to \$22.5 billion for 1982.

Increased interest rates on loan repayments in 1982 helped U.S. banks earn \$16.6 billion of foreign non-branch interest, an increase of 125 percent over 1980. Another factor was an "enormous increase in bank lending abroad" [12]. By comparison, U.S. corporations other than banks reported only a 16 percent gain in foreign non-branch interest, to \$5.9 billion.

Corporations in manufacturing and trade seemed more likely than corporations in other industry groups to operate through foreign subsidiaries. This practice is shown in Figure E by the high percentage of dividends (including dividend gross-up) these industries reported (48 percent

Figure D
Total Gross Income by Income
Type, 1982

¹Excludes branch income and specially allocable income.

and 47 percent of gross income, respectively). This is probably due to the sizeable foreign presence required for these industries to operate in foreign countries. Unlike corporations in these industries, financial companies seldom operated through foreign subsidiaries. These companies received only 4 percent of their gross income in dividends and dividend gross-up.

For 1982, U.S. corporations paid or accrued \$7.5 billion in foreign taxes on \$87.5 billion of "gross income" (see Figure D), an increase of 4 percent since 1980. Taxes withheld on dividends and rents, royalties, and license fees each accounted for 16 percent of this foreign tax. Manufacturers alone were responsible for nearly all of the tax withheld on dividends, rents, royalties, and license fees.

While interest income constituted one fourth of gross income, tax withheld on interest as a percentage of non-branch taxes paid or accrued was only 12 percent. This was largely due to low withholding rates associated with interest income, especially when U.S. tax treaties with foreign countries allowed for a zero withholding tax rate on this income. Almost three-fourths of the foreign tax on interest was withheld on payments to U.S. banks.

One type of income included but not shown separately in Figure D is foreign partnership

income. While corporations with a foreign tax credit earned \$13.9 million in partnership net income for 1982, those in oil and gas extraction reported losses totaling \$90.5 million. In comparison, domestic partnerships in the same industry sustained losses totaling \$7.7 billion [13].

Close to half of the taxes on the income depicted in Figure D were paid or accrued on "other" income. This income category is characterized by non-branch business receipts, generally from sales. The majority of this income (74 percent) was attributable to the petroleum industry. In contrast to the taxes, "other" income accounted for only 20 percent of total foreign gross income. Ninety-one percent of "other" taxes can similarly be attributed to corporations engaged in the petroleum industry.

The distribution of foreign gross income varied considerably by industry as shown in Figure E. The income and taxes of manufacturers approximated both the income and tax distribution for most income types at the all-industry level, as these corporations comprised over half of both total gross income and total taxes. While the wholesale and retail trade industries followed this pattern for income, over half of their taxes represented amounts withheld on dividends and less than 10 percent was paid on "other" income.

The other industry groups deviated substantially from the overall distribution. Finance, insurance, and real estate corporations, for example, received almost exclusively foreign interest income. For construction firms, a high concentration of income was from services.

Corporations in the motion picture and television production industry generally receive income from renting or licensing the use of their films and television shows. The majority (76 percent) of this industry's foreign-source gross income (\$1.1 billion) was from rents, royalties, and license fees. This income played a major role in the distribution of income for the services industry (which includes motion picture and television production) as shown in Figure E. Foreign taxes, however, represented only 2 percent of foreign rent, royalty, and license fee income for the motion picture and television production industry. In comparison, the average foreign tax rate on the same income type was 12 percent for all industries. This industry's rate was low because the United States has tax treaties with many major countries eliminating withholding taxes on this income [14].

Branch Income

As an alternative to foreign incorporation, many U.S. companies have established unincorporated foreign branches to operate in

 Note: Detail may not add to total because of rounding.

foreign countries. Income from these branches represented nearly one-fourth of total foreign-source taxable income. Branch income fell by a third, from \$21.9 billion for 1980 to \$14.6 billion for 1982. While foreign branch income fell for most industries, the reduction was most significant for manufacturing corporations. Eighty-nine percent of the \$7.3 billion decrease in branch income was accounted for by this industry, with nearly all of this decrease in the integrated petroleum industry.

The portion of total foreign-source taxable income received from foreign branches varied by industry. The following table provides an industry comparison of this relationship.

Foreign Branch Income as a Percentage of
Total Foreign-Source Taxable Income,
by Selected Industry, 1982

[Money amounts in millions]

1/ Less than \$500,000.

2/ Less than 0.05 percent.

Although U.S. banks received \$16.6 billion of foreign non-branch interest, two-thirds of bank taxable income was derived from foreign branches. As shown, the banking industry surpassed all other industries in the percentage of total foreign-source taxable income derived from foreign branches. Historically, U.S. banks have made foreign loans through foreign branches rather than establishing foreign banking subsidiaries.

For 1982, banking and manufacturing made up the greatest percentage of total branch taxable

income, 49 percent and 45 percent, respectively. The \$6.6 billion of manufacturing branch income represented less than 17 percent of all foreign income for manufacturers, while the corresponding portion for banking was nearly 67 percent (\$7.2 billion). In 1982, both banks and manufacturers each earned nearly half of total foreign branch income, although for 1980, banking represented only 34 percent while manufacturing accounted for 60 percent of the total.

SUMMARY

Between 1980 and 1982, the foreign tax credit claimed by U.S. corporations fell \$5.9 billion, a decrease of 24 percent. During 1982, many corporations experienced foreign or worldwide losses, reducing foreign taxes and precluding them from claiming a foreign tax credit. While many industries sustained decreases in foreign income, foreign taxes, and credit, the petroleum industry accounted for a substantial amount of these reductions.

Non-branch interest income emerged as the largest component of total foreign gross income in 1982, accounting for 26 percent of the \$87.5 billion total. Between 1980 and 1982, this income nearly doubled, with banks earning close to 75 percent of total interest income. This increase was due to both high interest rates and increased foreign lending.

Foreign branch operations were important to the banking industry, as 67 percent of banking foreign taxable income was earned through branches. While banks generally operate through foreign branches, corporations in the trade and manufacturing industries more often establish foreign corporations. This was shown by the high percentage of dividend income they earned in 1982.

DATA SOURCES AND LIMITATIONS

Sample Selection and Variability

The statistics for the 1982 Tax Year (which included accounting periods ending between July 1982 and June 1983) were estimated from a stratified probability sample of about 97,000 corporation income tax returns selected after revenue processing, but before audit. A description of the sample selection procedures for corporate returns is presented in the Appendix of this publication.

Returns claiming a foreign tax credit were selected for the 1982 statistics presented in this article from the general corporate sample. Slight differences exist between the 1982 foreign tax credit data presented here and the data previously published in Statistics of Income--1982, Corporation Income Tax Returns (and also shown in Table 8 of the Selected

Statistical Series, at the end of this publication). The differences exist because the statistics presented in this article include 1982 data for nine returns with foreign tax credit that were prescribed for inclusion in the 100 percent sample class, but were received too late to be included in the corporate sample statistics. However, estimates were used for the most significant (four) returns in the corporate statistics.

Sampling error is a limitation only to the extent that returns are selected at a rate of less than 100 percent. However, for this article, returns selected at the 100 percent rate accounted for the largest part of the estimated amounts. For instance, for 1982, corporations with \$250 million or more in total assets (which were selected at the 100 percent rate) accounted for almost all of total assets (97.6 percent), foreign tax credit claimed (96.2 percent), and foreign-source taxable income (95.9 percent) reported by all corporations claiming a foreign tax credit. Because of the predominance of these large corporations, sampling error is not considered a major limitation of the statistics.

General Limitations

The foreign tax credit is claimed under section 901 of the Internal Revenue Code. Corporations claiming a foreign tax credit generally provide supporting foreign income and tax data on Form 1118, Computation of Foreign Tax Credit--Corporations, attached to their U.S. Form 1120 income tax return. Form 1118 is the source of the foreign income and tax data for this article. The statistics do not reflect any adjustments that may be made during audit examination, when the acceptability of the foreign income and taxes reported for purposes of this credit is finally determined. In addition, some corporations provided only preliminary foreign income and tax data with their U.S. tax returns because not all the information on their foreign operations was available at the time the U.S. income tax return was filed.

There is a certain amount of undercoverage of foreign income and tax data. Some corporations with foreign income and taxes operated at a deficit and had no U.S. tax liability against which a foreign tax credit could be claimed. Other corporations may have chosen to deduct their foreign taxes from gross income rather than credit them against their U.S. tax liability. For these particular returns, it is believed that the foreign income and tax amounts were insignificant. In both circumstances, these returns would have been excluded from this study. In other instances, corporations did not provide a Form 1118 in support of the foreign tax credit claimed with their tax return as originally filed. Since the foreign tax credit

claimed by these corporations represented approximately 0.001 percent of the total foreign tax credit claimed by all corporations, it is believed that the income and tax data would be insubstantial. Certain Form 1120 data for these returns are, however, included in columns 1-17 of Table 1.

The U.S. tax law allows parent corporations to file consolidated income tax returns presenting the combined financial data of an entire group of affiliated corporations. Therefore, the actual number of corporations claiming a foreign tax credit is understated, as the statistics in this article represent the number of corporation income tax returns with foreign tax credit. For purposes of this article, however, the term "corporations" is used to denote "returns."

EXPLANATION OF SELECTED TERMS

Current-year foreign taxes.--Generally, current-year foreign taxes available for credit included (a) foreign taxes directly paid or accrued by a U.S. corporation on profits of foreign branch operations; withholding taxes on dividends, interest, rents, royalties and license fees; and other foreign taxes paid or accrued on partnership and services income; and (b) foreign taxes indirectly, or deemed, paid by a U.S. corporation. These "deemed paid" taxes were the taxes paid or accrued by a related foreign corporation on the profits from which dividends were paid (or constructive distributions made) to the U.S. corporation.

Dividend gross-up.--An amount of income equal to tax deemed paid that is associated with dividends received or includable income constructively received from foreign corporations.

Foreign-source taxable income.--Foreign-source gross income (including certain income "constructively" although not "actually" received, i.e., "foreign dividend gross-up" and "includable income of Controlled Foreign Corporations") less or "net" of the allocable deductions determined under the Internal Revenue Code and by provisions of any tax treaty between the United States and a particular foreign country. This taxable income was the amount on which the U.S. income tax on foreign earnings was determined. It could differ from the taxable income from overseas business operations and investments computed under foreign tax law, which was used as the basis for foreign taxation. In general, foreign-source taxable income included foreign branch profits, dividends received from foreign corporations, rental income, royalties, license fees, interest, gains from the sale of real property, and compensation for labor or services performed.

Specially allocable (section 863(b)) income.--Income partially earned within the United States

and partially earned within a foreign country or U.S. possession. In general, the income covered by section 863(b) is generated either by production within the United States and sales abroad or vice versa, or by transportation, telegraph, or cable services.

NOTES AND REFERENCES

- [1] For an explanation of the difference between the total foreign tax credit figure shown here and the figure shown in Statistics of Income -- 1982, Corporation Income Tax Returns and Table 8 of the Selected Statistical Series at the end of this publication, see the "Data Sources and Limitations" section of this article.
- [2] An article in the Fall 1986 Statistics of Income Bulletin will present geographically classified foreign income and tax data for corporations claiming a foreign tax credit for Tax Year 1982.
- [3] The amount of branch interest is not determinable because branch income is reported as taxable (not gross) income and is not allocated to specific types of income.
- [4] Since detailed corporate foreign tax credit statistics are available for only even numbered years, most foreign tax credit items are compared to 1980 rather than 1981 in this article.
- [5] The effective foreign tax rate is defined as current-year foreign taxes as a percentage of foreign-source taxable income. The U.S. effective tax rate was calculated as U.S. income tax after credits (except the foreign tax credit) as a percentage of worldwide taxable income. If the total available credits exceed the amount of tax, these other credits are limited, since the foreign tax credit is claimed before most other credits. The amount of these other credits that would have been claimed, if not for the foreign tax credit, was not tabulated. Including these unavailable amounts would slightly lower the U.S. effective tax rate.

- [7] For a more detailed explanation of the foreign tax credit limitation, see States, William, "Corporate Foreign Tax Credit, 1980: An Industry Focus," Statistics of Income Bulletin, Summer 1984, pp. 63-64.
- [8] Note that this high effective foreign tax rate may be a result of either high statutory rates on oil income or differences in foreign accounting principles, or both.
- [9] Since interest deductions were not determined exclusively for corporations claiming a foreign tax credit, the increase described represents these deductions for all corporations. See Statistics of Income, Corporation Income Tax Returns, for 1980 and 1982.
- [10] The calculation does not consider the small amount of unused tax credits (other than the foreign tax credit). For purposes of this calculation, excluding the foreign tax credit would increase the allowable amount of other credits. Including these unavailable amounts would slightly lower the amount of U.S. tax after credits, and, as a result, increase the ratio of current-year foreign taxes to U.S. income tax after credits (excluding the foreign tax credit).
- [11] A controlled foreign corporation (CFC) is generally described as a corporation created under the laws of a government outside of the United States and with more than 50 percent of the voting stock or more than 50 percent of all classes of stock owned by U.S. persons on any day during the taxable year of the CFC. An article in the Summer 1986 issue of the Statistics of Income Bulletin will present industrially classified controlled foreign corporation income and tax data for Tax Year 1982.

NOTE: The data in columns 1-17 pertain to the total activity of the domestic parent corporation. Since many corporations compute a foreign tax credit for more than one type of foreign income, the data in these columns are not additive. The data in columns 44 and 45 are reported as corporate totals only, not by type of income. The data in columns 19-22, 24, 27-32, 34, 36-40, and 43 of the foreign oil and gas extraction income line represent the amounts of total foreign oil related income and tax for those corporations reporting foreign oil and gas extraction income and taxes. The data in columns 23, 25, 26, 33, 35, 41, and 42 of the foreign oil and gas extraction income line are the actual foreign oil and gas extraction income and tax amounts. Form 1118 detail may not add to totals because of rounding.

High-Income Returns, 1983

By Allen Lerman*

Although only a small number - representing only a tiny fraction - of Federal individual income tax returns reporting incomes of at least \$200,000 do not show any tax liability, the actual number of such returns and their share of all high-income returns rose dramatically for 1983. As measured by adjusted gross income (AGI), the number of high-income returns not showing any income tax liability to either the United States or a foreign government increased by 194 percent, from 109 in 1982 to 321 for 1983. From 1982 to 1983, the proportion of all high-income returns that were nontaxable rose by 153 percent, to 0.162 percent of all high-income returns. Although precise increases varied depending on the definitions of income and nontaxability used, increases in the numbers and frequencies of nontaxable, high-income returns for 1983 were significant regardless of definition [1].

Actual numbers of nontaxable, high-income returns for 1983 reached the highest levels in recent history. Their proportion continued, at an accelerated pace, the steady upward creep occurring since 1979.

This article is part of a continuing series of reports summarizing the characteristics of high-income returns and the numbers of nontaxable, high-income returns since 1974.

The Tax Reform Act of 1976 required annual publication of data on individuals with high incomes as defined under four different income concepts, including the number of such individuals who did not pay any income tax and the importance of various tax provisions in making those individuals nontaxable [2]. Reports covering 1974 through 1976 and including the basic data and analyses of their implications were published by the U.S. Department of the Treasury's Office of Tax Analysis [3]. To make high-income data available to a wider audience, since 1979 selected data for high-income individuals, taxable as well as nontaxable, have been published, without analysis, by the Internal Revenue Service in separate chapters

of each year's Statistics of Income--Individual Income Tax Returns [4]. Publication of the 1983 data in the Statistics of Income Bulletin provides more scope for discussion of the data and of the implications of any changes.

This article is divided into four sections. The first, "Income Concepts: A Primer," describes and explains the differences between the two major and two minor concepts used to measure income. The second, "Measurement of Taxes," discusses the proper measurement of income tax burdens and explains the different treatment of the foreign tax credit, outlines the methodology used to equate the importance of exclusions and deductions as compared with tax credits, and reviews certain limitations in the data underlying this article. The third, "High-income Tax Returns for 1983," describes the contents of the data tables accompanying this article and includes selected observations about significant changes from previous years. The Fourth, "Increases in Nontaxable, High-income Returns, 1983," discusses some possible reasons for increases in the numbers of nontaxable, high-income returns for 1983.

INCOME CONCEPTS: A PRIMER

Economic Income, the Ideal Measure

High-income tax return data are published to help analysts assess the equity of the income tax system and its impact on high income families and individuals. For this purpose, both income and income taxes must be measured accurately.

Economists generally agree that for analyzing the impact of taxes, the ideal measure of income over a particular period of time, say a year, is the value of what the individual or family consumed over that period plus the change, if any, in its net worth [5]. For example, if during a year a family spent \$10,000 and saved \$2,000, economists would say the family had an income of \$12,000. Similarly, if the family spent \$10,000 but owned an asset such as an auto-

*Office of Tax Analysis, Office of the Secretary, U.S. Department of the Treasury.

mobile that has decreased in value by \$1,000, economists would say that the family had an income of only \$9,000.

A brief examination of the differences between income as defined by economists, often called economic income, and the adjusted gross income (AGI) concept, currently used for Federal income tax administration, illustrates some of the problems of measuring income, especially for high-income individuals.

Adjusted Gross Income

The concept of adjusted gross income was developed for tax administration. It was never meant to be an accurate measure of so-called economic income. Indeed, it is well recognized that AGI is deficient as a measure of economic income. AGI excludes certain types of income, such as interest from tax-exempt state and local government bonds, Social Security benefits, imputed rent on owner-occupied housing, and the value of many employee fringe benefits. Also, while not strictly excluded from AGI, income from other activities is deferred to a later year, or indefinitely, for income tax purposes. Depreciation deductions allowed for income tax purposes that exceed the decrease in the economic value of an asset often reduce AGI below economic income early in an asset's life. The resulting lower depreciation deductions in later years may raise AGI above economic income. The net effect, however, of accelerated depreciation is to postpone taxes, perhaps indefinitely [6].

Adjusted gross income excludes most changes in net worth, such as the excluded portion of realized long-term capital gains and all accrued, but unrealized, capital gains [7].

Even though some types of income are excluded, AGI may overstate economic income because some expenses incurred in the production of income are not deductible in the computation of AGI. Most of these expenses, however, are deductible from AGI in calculating taxable income, but only if the taxpayer "itemizes" deductions. Expenses falling into this category include certain expenses incurred by employees (such as union dues and expenditures for items used on-the-job but not reimbursed by the employer) and expenses attributable to a taxpayer's investments (as opposed to active operation of a trade or business), including, but not limited to, interest expense incurred in connection with investments in securities. Although net capital losses reduce economic income, only the first \$3,000 of net realized capital losses may be deducted in computing AGI. Any additional realized losses must be carried forward to future years. Moreover, only 50 percent of realized, net long-term capital losses may be deducted in computing AGI.

Redefining Income

Ideally, the impact of all taxes should be measured relative to economic income. However, no accurate, detailed data on such a broadly-defined income measure are available from income tax returns (or from any other source) for a cross-section of American taxpayers. As a practical matter, any broad income measure must be calculated from data already available from Federal individual income tax returns. Thus, a more comprehensive income measure must start from AGI and, to the extent that data are available, must make adjustments for omitted income items and expenses that ought to be deductible in calculating economic income [8].

Omitted Income and Accelerated Deductions

Tax returns contain information about only a portion of the income included in economic income but excluded from AGI. The omitted income that can be identified on tax returns consists of the excluded portion of long-term capital gains (and current-year losses in excess of currently deductible amounts), the dividend exclusion of up to \$100 per tax return (up to \$200 on joint returns), the "all-savers" interest exclusion, payments to Keogh and IRA pension savings plans, and income from sources considered to be tax preferences for purposes of the alternative minimum tax. For 1983, unless such preferences were large enough to result in payment of alternative minimum tax, taxpayers did not have to file Form 6251 (Alternative Minimum Tax Computation), and the total amount of most types of 1983 preference income is not known [9].

Even after including preference income which is not in AGI but which is identifiable on tax returns, several major sources of income for high-income taxpayers are still omitted:

- Interest on tax-exempt state and local bonds;
- All accrued but unrealized income, primarily unrealized capital gains;
- Certain agricultural expenses deducted when paid, even though related income items are not includable in income until a later year;
- Imputed rental income from owner-occupied housing and from consumer durables;
- Straight-line depreciation deductions on real estate to the extent that they exceed economic depreciation;
- Income "sheltered" from taxation -- primarily partnership income -- through deferral of the recognition of income

for tax purposes and/or the acceleration of deduction items; and

- The value of employee fringe benefits [10].

For real estate, the combination of a shorter life for tax purposes than the true economic life of the property and the use of accelerated depreciation methods may produce tax depreciation deductions exceeding economic depreciation, especially in the early years of ownership. In the future, income may be correspondingly higher, but in the meantime, the taxpayer has had the interest-free use of the deferred taxes. Also, if taxed in the future, the income may be converted into a long-term capital gain, which is taxed at a lower rate than is ordinary income.

Because income sources not identifiable from tax return data are excluded, all income measures used in the data for this article may understate economic income. As a consequence, some individuals with high economic incomes may have been omitted completely from the high-income group covered by this report. Moreover, even for individuals who are included, the income of some has been understated, and tax as a percentage of income (i.e., the effective tax rate) has been overstated.

Investment Expenses

In measuring economic income, it generally would be appropriate to deduct all expenses incurred in the production of income, including those related to any income-producing investments. Since economic income would include all investment income, including accrued capital gains and losses, it would be proper to deduct all investment expenses without limit. Investment expenses in excess of income would then represent net economic losses, roughly akin to "net operating losses" from a trade or business. However, such a liberal deduction for investment-related expenses is not necessarily correct when all income items have not been included currently.

If all income has not been included currently, full deduction of investment expenses might represent a mismatching of receipts and expenses and might result in understating income. For example, if a taxpayer borrowed funds to purchase securities, net income would be understated if the taxpayer deducted all interest payments on the loan but did not include as income any accrued gains on the securities. A similar mismatching of income and expenses would occur if investment expenses that should properly be capitalized were deducted when paid. In these instances, a more accurate measure of income might be obtained by post-

poning the deduction of the expense until such time as the income were recognized for tax purposes.

Additional problems are created when a person with a loan has both income-producing assets, such as securities, and non-income-producing assets, such as a vacation home or yacht. It is not possible to determine what portion of the interest expense should be attributed to taxable income-producing assets and, therefore, ought to be deductible against the gross receipts from such taxable assets.

As a result of these problems, it has been necessary to set arbitrary limits on the amount of investment expenses which are deductible in calculating a broader measure of income.

Investment expenses that have not been deducted in determining AGI generally appear on a Federal individual income tax return in two places. Investment interest appears as part of the itemized deduction for interest; other investment expenses such as management fees are included in the miscellaneous category of itemized deductions [11]. To determine expenses that should be deductible in calculating an approximation to economic income, investment expenses have been defined as the entire interest deduction other than the interest paid on a home mortgage. Other investment expenses could not be determined since they could not be separated from the remainder of "miscellaneous deductions." Hence, they have not been used in the adjustment for investment expenses.

To the extent that interest expenses do not exceed investment income, they have been allowed as a deduction in the computation of a broader measure of income. One consequence of this definition is that investment expenses can never turn positive investment income into investment losses. Generally, allowing investment expenses to offset all investment income is generous and tends to understate broadly measured income. However, in some instances, limiting investment expenses to investment income may overstate income by disallowing genuine investment losses. This arbitrary procedure has been selected because, with the omission of accrued capital gains from measured income, allowing all investment expenses to be deducted would represent a mismatching of income and expenses.

The amount of investment income against which investment interest can be offset depends on the amount of investment income included in the income measure under consideration. Investment income consists of interest, dividends, and net capital gains (or losses). However, if only a portion of capital gains are included in the income concept, as is the case with AGI, then only that portion is considered to be invest-

ment income. A similar adjustment is also made for the dividend exclusion of up to \$100 per tax return (\$200 on a joint return) and for the all-savers exclusion for interest income.

Expanded Income

The Congress has asked for high-income data to be tabulated on the basis of a measure closely approximating economic income but using only data available on tax returns. This measure is called "expanded income."

Expanded income is defined as adjusted gross income plus items of tax preference income excluded from AGI less investment expenses to the extent that they do not exceed investment income [12]. Tax preferences considered are the \$100-per-tax-return exclusion for qualifying dividends (\$200 on a joint return), excluded "all-savers" interest, the excluded portion of net long-term capital gains, and, where the taxpayer has filed a Form 6251 (Alternative Minimum Tax Computation), all other excluded income preferences subject to the minimum tax [13]. For individuals, the only preference income items of significance other than the excluded portion of capital gains are the excess of accelerated depreciation over straight-line depreciation on real property and on personal property subject to a lease, the excess of percentage depletion over the cost of the property, and deductions for intangible drilling costs in excess of the amounts deductible if these costs had been amortized. Because expanded income is based on tax return data, it excludes items such as interest on tax-exempt state and local bonds, accrued but unrealized capital gains, straight-line depreciation on real estate in excess of economic depreciation, most employee fringe benefits, and other items mentioned under "Omitted Income and Accelerated Deductions."

Four Income Measures

The Congress has mandated that high-income tax return data be selected and classified on the basis of four definitions of income. Expanded income and AGI have already been discussed. Each of the two other measures embodies only one of the two major differences between expanded income and AGI. "Adjusted gross income plus tax preferences" is AGI plus the amount of tax preference income excluded from AGI. "Adjusted gross income less investment interest" is AGI less the amount of investment interest to the extent that it does not exceed investment income.

When ranked according to size of income, AGI plus references is largest, AGI less investment interest is smallest, and AGI and expanded income fall in the middle. For any given taxpayer, AGI can be larger or smaller than ex-

panded income depending on whether preferences are larger or smaller than investment interest.

The four income concepts are related in the following manner [14]:

$$\begin{aligned} \text{Expanded income} \\ &= \text{Adjusted gross income} + \text{preferences} - \\ &\quad \text{investment interest} \end{aligned}$$

$$\begin{aligned} \text{Adjusted gross income} \\ &= \text{Expanded income} - \text{preferences} + \\ &\quad \text{investment interest} \end{aligned}$$

$$\begin{aligned} \text{Adjusted gross income plus preferences} \\ &= \text{Adjusted gross income} + \text{preferences} \end{aligned}$$

$$\text{or} \quad = \text{Expanded income} + \text{investment interest}$$

$$\begin{aligned} \text{Adjusted gross income less investment interest} \\ &= \text{Adjusted gross income} - \text{investment} \\ &\quad \text{interest} \end{aligned}$$

$$\text{or} \quad = \text{Expanded income} - \text{preferences}$$

Expanded income is the measure which most closely approximates economic income.

MEASUREMENT OF TAXES

Foreign Tax Credits: Worldwide Taxes on Worldwide Income

Just as income must be measured properly, so must income taxes.

United States income taxes are based on global (worldwide) income. Thus, U.S. citizens and residents generally must include income on their U.S. income tax returns regardless of whether it has been generated in the United States or in a foreign country. However, when a taxpayer has foreign source income, the U.S. income tax computed on global income may often be reduced dollar-for-dollar by the amount of foreign income taxes that have been paid on that foreign income. These offsets for foreign income taxes are called "foreign tax credits" [15].

Statistics of Income (SOI) data collected as a by-product of tax administration include global income as reported on U.S. income tax returns. The SOI data, however, usually include only U.S. income taxes net of the foreign tax credits that represent offsets for foreign income tax payments. Where taxpayers have income from foreign sources, this procedure understates their tax liabilities and their effective tax rates. Since worldwide income is reported on U.S. tax returns, a more accurate measure of the tax burden imposed on that income would be obtained if all income taxes--U.S. as well as foreign--were also included. Analysis of high-income tax returns

indicates that a substantial portion of the so-called nontaxable, high-incomes have large shares of their income from non-U.S. sources and have paid substantial amounts of foreign income taxes on that income. Thus, it does not seem appropriate to classify these individuals as nontaxable or to classify their foreign tax credits as special tax benefits.

In order to present a more realistic picture of the number of nontaxable, high-income tax returns and the reasons they were nontaxable, several tables and charts in this article have been prepared by redefining income tax liability to consist of the total amount of U.S. income taxes (income taxes after credits plus the alternative minimum tax) plus the amount of foreign tax credits. Because information on foreign tax liabilities is not available on U.S. income tax returns, foreign tax credits were selected as a proxy for foreign tax liabilities. Where foreign tax rates exceed U.S. rates, and in certain other instances, foreign tax credits actually will be less than foreign tax liabilities. In such cases, using foreign tax credits as a proxy for foreign taxes understates global income tax liability. In cases in which foreign tax credits are for taxes paid on income from earlier years, use of foreign tax credits may either overstate or understate global taxes on the current year's income.

Tables redefining tax liability to include the foreign tax credit attempt to present an approximation of the true worldwide (global) income tax burden on worldwide income. For the vast majority of taxpayers--with high incomes or otherwise--this adjustment is irrelevant, for they have little or no foreign source income. However, for the small proportion of taxpayers with substantial foreign income, this adjustment is important. The policy implications of a person with a very large amount of income not paying U.S. income tax certainly would be different if U.S. nontaxability were the result of the person's living and working abroad and paying substantial amounts of foreign tax than if all income were from U.S. sources and the person paid no income tax to either the U.S. government or any other government.

In order to be consistent with data from earlier years, all tables showing nontaxability or the amount of taxability on the basis of worldwide tax liability have been duplicated by other tables with tax liability defined in the more traditional way used for tax administration purposes: U.S. income tax liability after subtracting the value of any foreign tax credits.

Comparing Exclusions, Deductions, Tax Credits, and Special Tax Computations

In order to compare the importance of various exclusions, deductions, tax credits, and special tax computations (such as the alternative minimum tax on tax preferences and the income averaging tax computation), the different types of items must be put on the same basis. One way of doing so is to calculate the size of the deduction that would reduce (or increase) income tax by the same amount as a tax credit. This amount is called the "deduction equivalent" of the tax credit.

The deduction equivalent of a tax credit or a special tax computation is the difference between the taxable income that, using ordinary tax rate schedules, would yield the actual tax before the provision in question is considered and the actual tax after the provision. For example, the "deduction equivalent of all tax credits" is equal to the difference between "taxable income which would yield tax before credits" and "taxable income which would yield tax after credits."

Using this method of equating the value of deductions, exclusions, credits, and special tax computations, the order in which the various credits and special tax computations are calculated affects the value of their deduction equivalents. Because the tax rate schedules are progressive with successive increments to income taxed at successively higher tax rates, the deduction equivalent of the credit converted last to a deduction equivalent will be larger (for the same amount of a credit) than the item converted first.

The deduction equivalents of tax credits shown in the accompanying tables were computed by assuming that deductions and exclusions reduced taxes before tax credits. As a result, the deduction equivalent of tax credits is biased upwards.

Share of Income Subject to Tax

The total impact of various deductions, exclusions, tax credits, and special tax computations can be measured only if the aggregate value of all of, or groups of, these items in reducing, or increasing, income taxes is put on a comparable basis. Two often-used measures of the value of deductions and exclusions are the share of income that has been excluded from tax and the share of income that remains subject to tax. The latter measure can also include the impact of tax credits and special tax computations if the deduction equivalent of these items is added to taxable income defined in the ordi-

nary manner. Doing so yields what the tables accompanying this article call "taxable income which would yield income tax before credits," "taxable income which would yield income tax after credits," and "taxable income which would yield total income tax." These measures could be computed directly from taxable income and from the deduction equivalents of the appropriate items. However, these measures have been computed by using the tax rate schedules to calculate the amounts of taxable income that would have been necessary (when subject to tax under the appropriate, ordinary tax rate schedule) to yield the given amounts of tax.

Unaudited Data

Tax return data used in the Statistics of Income program have been tabulated as they have been reported on tax returns filed with the Internal Revenue Service. Certain, obvious arithmetic errors have been corrected, and certain adjustments have been made to achieve consistent statistical definitions. Otherwise, the data have not been altered. In particular, the data do not reflect any changes that may have been made or that are likely to be made in the future as a result of IRS audits. While this is true of data throughout the entire SOI program, it is of particular relevance for high-income tax returns. Because of the greater complexity of these returns, there is a higher probability of error and more scope for disagreement about the proper interpretation of tax laws.

The fact that the data have been drawn from unaudited returns is of even greater importance for those high-income returns that are nontaxable. Almost any audit changes would make such returns taxable. Even where the tax consequences were minor, such returns would be reclassified from nontaxable to taxable, thereby changing the counts of nontaxable returns.

HIGH-INCOME TAX RETURNS FOR 1983

This section contains 13 tables and four charts with data from income tax returns, mainly those with incomes of \$200,000 or more. Data are shown for all returns, and separately for taxable and nontaxable returns. Data in Tables 1 through 12 are from 1983 income tax returns. Data in the remaining table (Figure A) and in the four Charts (Figures B through E) summarize nontaxable, high-income returns from 1977 through 1983.

Separate parts of four of the 1983 tables contain data on high-income returns as defined by each of four different income concepts. In the remaining 1983 tables, data are depicted for the two main income concepts, adjusted gross income and expanded income.

The tables show:

- The numbers of high-income returns (total, taxable, and nontaxable) under the various income concepts (Tables 1 and 2);
- The numbers of high-income, non-taxable returns and the relative frequency of such returns from 1979 through 1983 (Figures A through E);
- The distributions of taxable income as a percentage of total income (Tables 3 and 4);
- The distributions of effective tax rates, that is, income tax as a percentage of income (Tables 11 and 12);
- The frequencies and amounts of various sources of income, exclusions, deductions, and tax credits, as well as the relationships between all four income concepts used in this article (Tables 5 and 6);
- The frequencies with which various deductions and tax credits are the most important and second most important items in reducing (or eliminating) income taxes (Tables 7 and 8); and
- The frequencies with which various itemized deductions and tax credits occur as certain percentages of income (Tables 9 and 10).

Tables 1, 3, 5, 7, 9, and 11 and Figures B and D contain data with foreign tax credits treated as items which reduce U.S. income taxes; this is the treatment on tax returns. Tables 2, 4, 6, 8, 10, and 12 and Figures C and E are similar to the first set of tables and figures but treat foreign tax credits as part of the individual's income tax liability. Figure A includes both types of data. This different treatment is explained in more detail under the heading "Foreign Tax Credits."

Numbers of High-income Tax Returns

For 1983, the numbers of tax returns with incomes of \$200,000 or more ranged from 187,321 to 262,453, depending on the income concept. These numbers represent from 0.19 percent to 0.27 percent of all tax returns filed. (Tables 1 and 2.)

For 1983, there were 249,319 income tax returns with expanded income of \$200,000 or more. Of these, 579, or 0.232 percent, had no U.S. income tax liability, and only 437, or 0.175 percent, showed no worldwide income tax liability.

There were 198,608 tax returns with AGI of \$200,000 or more. Of these, 447, or 0.225

Figure E.
Number and Percent of Returns with Expanded Income of \$200,000 or More Without Total Income Tax as Modified for the Foreign Tax Credit, 1977-1983

percent, reported no U.S. income tax, and 321, or 0.162 percent, had no worldwide tax liability.

U.S. Tax Liability. If only income payable to the United States are considered, between 229 and 810 of all high-income returns (depending on the income measure used) were nontaxable (Table 1). This represents a change from 1982, ranging from a 3 percent to a 110 percent increase. The numbers of nontaxable returns increased more rapidly than high-income tax returns overall, so that the proportion of nontaxable, high-income returns increased from 1982. As measured by expanded income, the number of nontaxable returns increased by 93 percent, from 299 for 1982 to 579 for 1983, and the proportion of nontaxable returns increased from 0.144 percent to 0.232 percent in 1983. As measured by AGI, the number of nontaxable returns increased by 71 percent to 447 for 1983, and the proportion of such returns rose from 0.155 percent to 0.225 percent (Figure A).

Overall, 1983 nontaxable, high-income returns represented only a small proportion (0.122 percent to 0.309 percent) of all high-income returns, but in most cases the proportion increased dramatically. These increases represent the continuation of a trend that, except for 1982, has been occurring since the proportion of nontaxable, high-income returns reached historical lows in 1979. As measured by expanded income, a high-income return was two and one-half times more likely to be nontaxable for 1983 than for 1979. As measured by AGI, the probability that a high-income return would be nontaxable had tripled (Figure A).

Worldwide Tax Liability. If nontaxability is measured by worldwide income tax liabilities, between 108 and 663 high-income returns were nontaxable. Thus, treating foreign tax credits as if they represent tax payments reduced the numbers of nontaxable returns (and the probability of being nontaxable) by 25 percent to 53 percent, depending on the income concept used.

Both the numbers of nontaxable returns and their proportion of all high-income returns increased markedly from 1982. As measured by expanded income, the number of nontaxable returns almost tripled, from 153 to 437. As measured by AGI, the number of returns more than tripled, rising from 109 for 1982 to 321 for 1983. (Figure A.)

As measured by worldwide income tax, the probability of being nontaxable increased in 1983 under all four income concepts. This increase continued a general pattern of increases from the 1979 lows. Thus, by 1983, a high-income tax return was from 176 percent to 440 percent more likely to be nontaxable than for 1979.

Data in Figure A can be used to calculate the numbers of nontaxable returns due primarily to foreign income tax payments, as evidenced by foreign tax credits. Between 1982 and 1983, the number of such returns actually declined slightly, no matter which income concept was considered.

Number of Returns Nontaxable Because of Foreign Tax Payments by Income Concept, 1982 and 1983

Income concept	1982	1983
	(1)	(2)
Adjusted gross income (AGI)...	153	126
Expanded income.....	146	142
AGI plus preferences.....	153	147
AGI less investment interest..	145	121

Income concept	Change 1982 to 1983	
	Number	Percent
	(3)	(4)
Adjusted gross income (AGI)...	-27	-18%
Expanded income.....	-4	-3
AGI plus preferences.....	-5	-3
AGI less investment interest..	-24	-17

The declines as percentages of all high-income returns were even larger. Thus, the increase in the numbers of nontaxable, high-income returns for 1983 is not attributable to the foreign income taxes or foreign tax credit.

Tables 3 and 4 show the distributions of high-income returns by the ratios of taxable income (as adjusted to reflect tax credits and special tax computations) to total income on the returns. The tables illustrate three important facts about high-income tax returns.

1. As already described, only a small proportion of high-income taxpayers are able to escape all income taxes.
2. Another group of high-income taxpayers--still a small group but larger than the nontaxable group--is able to offset half or more of its income before being subject to tax. This type of high-income taxpayer pays income tax equal to only a small share of its income, perhaps a smaller share of income than that of a typical median-income family. Such taxpayers are called "nearly nontaxables."

Legitimate questions can be raised about whether this nearly nontaxable group is paying its "fair share" of the aggregate income tax. Despite the small amount of tax payable by the nearly nontaxables,

they have escaped the notoriety accorded high-income tax returns showing absolutely no tax liability.

- Overall, a large portion of high-income taxpayers are subject to tax on a large share of their income and pay very substantial amounts of tax.

Tables 11 and 12 represent another way of showing the distributions of tax returns by tax burden. These two tables classify all tax returns by both the size of income and the effective tax rate, i.e., income tax as a percentage of income.

- These tables illustrate the distribution of effective tax rates for high-income returns as compared with the distribution for returns with lower income levels: under \$50,000; \$50,000 to \$100,000; and \$100,000 to \$200,000.
- The tables also illustrate the wide dispersion of effective tax rates for high-income returns. While 1.6 percent of high expanded income returns show tax liabilities of less than 10 percent of expanded income, 1.6 percent had effective tax rates of 45 percent to 50 percent of income, and approximately 0.2 percent had tax liability exceeding half of their income. More than 82 percent had average tax rates ranging from 15 percent to 45 percent of income, with over half of high-income taxpayers having effective tax rates between 20 percent and 40 percent of income.

Tables 5 and 6 show, in the aggregate, the frequencies and amounts of the types of income; the items of tax preference; and the various deductions, credits, and income taxes shown on high-income returns. By comparing the columns for nontaxable returns with those for taxable returns, some of the different characteristics of nontaxable returns can be deduced. For example, the ratios of both partnership income to total income and partnership losses to total income were far higher on nontaxable returns.

Tables 7 and 8 classify tax returns by the items that had largest and second largest effects in reducing or eliminating income tax. For the returns on which each primary item is most important, the tables show the distributions of the second most important items. For example, on taxable returns with expanded incomes of at least \$200,000, the most important item on 45 percent of the returns was the itemized deduction of state and local taxes. For those returns on which taxes were the largest item, the itemized deduction for interest payments was the second most important item 40 percent of the time and charitable contributions were the second most important 37 percent of the time. Conversely, on nontaxable returns

(with no worldwide tax), the interest-paid deduction was the most important item 62 percent of the time. And where interest paid was the primary item, there was no secondary item 51 percent of the time, charitable contributions were the second item 24 percent of the time, and the deduction for taxes paid was second most important 18 percent of the time.

Tables 9 and 10 represent another way of illustrating the importance of various tax provisions in reducing or eliminating income tax. Unlike Tables 7 and 8, these tables show data only for nontaxable returns. For returns without any income tax, these tables show the number of times that various items reduced income by different fractions of income. The items shown are the various categories of itemized deductions, total tax preferences excluded from income, and the deduction equivalents of four different types of tax credits. For example, for high expanded income returns with no worldwide tax, the itemized deduction for casualty losses exceeded 100 percent of expanded income on 10 of 437 returns, and the deduction equivalent of the investment credit was between 50 percent and 100 percent of expanded income on three returns.

INCREASES IN HIGH-INCOME, NONTAXABLE RETURNS, 1983

The tabulations of data for 1983 that show large increases in both the absolute numbers of nontaxable, high-income returns and the frequencies with which they occurred provoked skepticism by this author about the data's accuracy, followed by attempts to determine and explain the possible reasons for the increases.

Data Accuracy

The existence of such a large number of nontaxable, high-income returns has been verified by the manual review of each of the 447 nontaxable, high-AGI tax returns. Manual review confirmed that all 447 returns do exist and that all of them were nontaxable, as nontaxability has been defined for these purposes since the 1970's.

The review did disclose, however, that 67, or 15 percent, of the returns actually did have some income tax liability attributable to recapture of investment credits allowed in prior years. Although this finding does not alter the fact that significantly more returns were nontaxable for 1983 than for the immediately preceding years, it does raise questions about the proper definition of nontaxability.

Analyses of nontaxable, high-income returns have focused on finding taxpayers with large amounts of income who pay little or no income tax, as well as the features of the tax system

which allow them to escape taxation. Such information provides a basis for discussing whether such features are appropriate in a broadly based income tax system and whether they should be changed. In this regard, interest originally focused on current-year tax on current-year income. Thus, any taxes that may have depended on prior-year income were not considered, including any current-year tax resulting from early disposition of assets and the recapture of investment credits allowed when those assets were acquired. Furthermore, manual examination of tax returns for 1975 and 1976 did not indicate that the taxability or nontaxability of any high-income return depended on investment credit recapture. Thus, as a practical matter, the proper treatment of investment credit recapture was not deemed important.

Even though single-year tabulations of data from tax returns generally show tax attributable to a single year, there are multiyear effects from several income tax features that render income tax returns "impure" as a measure of one year's tax on one year's income. Most relevantly, the investment credit itself is taken for the year equipment is acquired even though the equipment is expected to be used for several years. Similarly, depreciation deductions may be accelerated, resulting in a mismatching of the income from, and the expenses attributable to, an asset. In this regard, a return could become nontaxable in one year primarily because of an investment credit. Current methodology could classify that taxpayer as nontaxable in later years even if the person paid tax from the recapture of some of the investment credit previously allowed. These considerations would argue for symmetrical treatment. Since deductions and credits have been considered even if they are for income extending more than one year, taxes ought to be treated in the same way.

Symmetrical treatment would suggest that any taxpayer who pays tax from the recapture of a prior-year investment credit ought not be considered nontaxable. Because changing the classification of such returns for 1983 would not result in major changes, no attempts will be made to retabulate the data because of this definitional change. It is, however, anticipated that the definitions of nontaxability will be altered for 1984 and subsequent years.

The previously mentioned manual review of nontaxable, high-AGI returns did show that if any return with investment credit recapture were treated as taxable, there would have been only 380 nontaxable, high-AGI returns for 1983. The 380 nontaxable returns would have been 0.19 percent of all high-AGI returns. Since corrected data for 1982 are not available, the percentage change for 1982 cannot be known with precision, but at minimum the increase was 45

percent. For high-AGI returns with tax redefined to include foreign tax payments, a redefinition of nontaxability to exclude returns with tax only from investment credit recapture reduces the number of nontaxables by 59 returns, or 18 percent, from 321 to 262.

Similar adjusted data using the expanded income concept are not available.

Reasons for 1983 Changes

The significant increases in the numbers of nontaxable, high-income returns for 1983 seem to be attributable to the elimination of the minimum tax and the taxation of all preference items under the expanded alternative minimum tax. These changes were enacted as part of the Tax Equity and Fiscal Responsibility Act of 1982 (commonly called TEFRA) and became effective for 1983. The increase in nontaxable, high-income returns seems to stem from changes in the list of itemized deductions that may give rise to tax preferences under the alternative minimum tax.

In 1982, the Congress eliminated the minimum tax and transferred the taxation of all tax preferences to a more comprehensive alternative minimum tax. In part, these changes were intended to reduce taxes for some taxpayers who had modest amounts of tax preferences but who paid substantial amounts of ordinary income tax. The primary goal, however, was to concentrate the burden of (alternative) minimum taxation on those who would otherwise not pay a fair share of the total tax burden relative to their incomes. This objective was clearly stated:

"Congress amended the present minimum tax provisions applying to individuals with one overriding objective: no taxpayer with substantial economic income should be able to avoid all tax liability by using exclusions, deductions and credits. Although these provisions provide incentives for worthy goals, they become counter-productive when individuals are allowed to use them to avoid virtually all tax liability. The ability of high-income individuals to pay little or no tax undermines respect for the entire tax system and, thus, for the incentive provisions themselves. Therefore, Congress provided an alternative minimum tax which was intended to insure that, when an individual's ability to pay taxes is measured by a broad-based concept of income, a measure which can be reduced by only a few of the incentive provisions, tax liability is at least a minimum percentage of that broad measure" [16].

The major change made by TEFRA to minimum taxation of individuals was the concentration of the taxation of all preference items under the alternative minimum tax rather than having

the capital gains exclusion and preferences for itemized deductions taxed under the alternative minimum tax and all other preferences taxed under the minimum tax. Other changes were also made. The alternative minimum tax exclusion was raised to \$30,000 (to \$40,000 for joint returns) from its previous level of \$20,000. Some new preferences items were added for exclusions and deferrals of income. Finally, the list of itemized deductions that may give rise to an alternative minimum tax preference was altered, and the way in which the itemized deduction preference is calculated was changed [17].

Calculation of tax preferences from itemized deductions was changed so that an eligible itemized deduction became more likely to generate a tax preference for 1983 than it was for 1982. Hence, it was believed that the TEFRA changes would make it more likely for itemized deductions to give rise to the alternative minimum tax. For 1982, the preference from itemized deductions was the amount by which a taxpayer's total itemized deductions (other than the itemized deductions for medical expenses, casualty losses, and state and local taxes) exceeded 60 percent of AGI as reduced by the just mentioned itemized deductions. Thus, itemized deductions could be a tax preference only if their total represented a large share of AGI. Beginning with 1983, every dollar of certain categories of itemized deductions could generate a tax preference, even if the particular itemized deduction or the total of all itemized deductions represented only a modest share of AGI.

In addition to changing the structure of the itemized deduction tax preference under the alternative minimum tax, TEFRA changed the list of itemized deductions that could result in preferences. Before TEFRA, preferences generally could come from any itemized deduction other than those for medical expenses, casualty losses, and deductible state and local taxes. After TEFRA, tax preferences could come from any itemized deduction other than charitable contributions, casualty losses, mortgage interest expense, investment interest to the extent of investment income, gambling losses, and the medical expense deduction to the extent that the allowable portion exceeded 5 percent of AGI. These were quite dramatic changes. The only items left unchanged were casualty losses and the medical expense deduction to the extent that the allowable deduction exceeded 5 percent of AGI. Most importantly, under the new law, a preference could be generated by any amount of state and local tax expenses. Preferences, however, could no longer be generated by charitable contributions, mortgage interest, gambling losses, or most deductible investment interest [18].

These changes were believed to represent a significant tightening of the alternative mini-

um tax. In fact, the changes seem to have provided the means for a major increase in the number of nontaxable, high-income returns.

The impact of these minimum tax changes has been approximated for nontaxable, high-AGI returns for 1983 that had no U.S. tax liability and did not have any tax from recapture of prior-year investment credits. To the extent possible based on data shown on 1983 tax returns, the impacts of the 1982 minimum tax and the 1982 alternative minimum tax have been simulated for these returns. The simulation indicates that if the 1982 provisions had been in effect for 1983, 362 of the 380 returns would have been taxable. That is, only 18 of the 380 returns that were actually nontaxable for 1983 would have remained nontaxable. In addition, 15 returns that were taxable for 1983 would have been nontaxable if the 1982 provisions had remained in effect. Thus, this simulation indicates that there would have been a total of only 33 nontaxable, high-AGI returns for 1983 if the 1982 minimum and alternative minimum tax provisions had not been altered. Most of these changes appear to stem from changes in the preference for itemized deductions.

A similar simulation for the high-AGI returns where the foreign tax credit has been redefined to represent a legitimate tax indicates that of the 262 returns that actually were nontaxable for 1983 (including no tax from investment credit recapture), 245 would have been taxable if the minimum and alternative minimum tax provisions had remained as in 1982. Leaving those provisions unchanged would also have resulted in an additional 13 returns being made nontaxable, for a nontaxable total of 30 returns.

Since the numbers of nontaxable returns estimated by these simulations is far below the numbers of returns actually found by tabulating 1982 data, the simulation results must be treated with caution, and the precise effects of the minimum and alternative minimum tax changes made by TEFRA remain unknown. Nevertheless, together with an analysis of what could have happened for 1983 compared with 1982 for returns with hypothetical combinations of itemized deductions, these simulations indicate that the changes attributed to TEFRA's alternative minimum tax are both possible and probable.

In TEFRA in 1982, the Congress enacted changes to increase the overall level of minimum taxation, to concentrate such taxes on individuals whose tax preferences represented a large share of their income, and to reduce the number of nontaxable, high-income returns. The changes apparently have accomplished the first two goals. They do not, however, appear to have been successful in achieving the third goal. In fact, the alternative minimum tax changes in

TEFRA--particularly the changes in the types of itemized deductions that may give rise to tax preferences--have actually opened the way for a significantly larger number of nontaxable, high-income tax returns.

High-income taxpayer data for 1977 and 1978 have been tabulated but not published, except for the actual number of high adjusted gross income nontaxable returns. Data for 1977 and 1978 and a brief explanation of the tables may be published in a future issue of the Statistics of Income Bulletin.

[5] This is the Haig-Simons definition of income.

[6] The Internal Revenue Code defines adjusted gross income as all gross income that is not specifically excluded or reduced by statutory adjustments. Among the exclusions are trade or business deductions (including some deductions by employees) and depreciation deductions allowable for tax purposes, the deduction for 60 percent of net long-term capital gains, limited deductions for losses from the sale or exchange of property, deductions attributable to rents and royalty income, the moving expenses adjustment, and deductions for contributions to individual retirement arrangements (IRA's) and self-employed (Keogh) retirement plans.

[7] Gross income includes only income that has been "realized." Thus, for tax purposes, accrued increases or decreases in the value of assets are generally not included in income until any gain or loss is realized by a sale or exchange. In addition, gross income does not include the value of the services received from the use of durable goods, such as imputed net rent from owner-occupied homes or from consumer durables. Finally, gross income and, hence, adjusted gross income, do not include interest on most types of state and local government debt, social security benefits, workers' compensation benefits, and most types of welfare benefits.

[8] There have been attempts to create micro-data files that include approximations of economic income. Tax return data files have been "statistically merged" with other files such as the Current Population Survey (CPS) of the Bureau of the Census. After the merge, certain additional data items that were not on either file have been "imputed" to each record of the merged file. Although such statistically merged files have proven useful for many purposes, they have only limited use--and must be used with great caution--for high-income individuals and families, each of which is likely to have more unique financial and income characteristics that are not likely to be duplicated accurately through imputations and statistical merges.

[9] If the sum of tax preferences that were subject to the alternative minimum tax (including both preferences representing income excluded from adjusted gross income and certain itemized deductions that may be considered preferences) together with the taxpayer's AGI and ordinary income tax were sufficient to result in the imposition of any alternative minimum tax, the taxpayer was required to complete Form 6251, Alternative Minimum Tax Computation. For such taxpayers, the tax preferences excluded from adjusted gross income, as tabulated in Tables 5 and 6, include the following items: the dividend exclusion; the "all-savers" interest exclusion; the excluded portion of long-term capital gains; the excess of accelerated depreciation over straight-line depreciation on certain real property and property subject to a lease; the excess of rapid amortization allowable on certain capital expenditures (such as pollution control facilities) over depreciation otherwise allowable; the excess of percentage depletion over the "adjusted basis" of the property; unrealized gain on the exercise of stock options; and certain intangible drilling

costs to the extent that they exceeded the otherwise-allowable amortization deduction.

Any preferences from itemized deductions do not represent omitted income; hence, they have not been counted as preference items in calculating a broader measure of income.

Before 1983, preferences had to be listed on income tax returns if total preferences other than the capital gains exclusion and any preferences from itemized deductions were at least \$10,000 (\$5,000 for married taxpayers filing separately). Preferences had to be listed and included with the income tax return even if they did not give rise to any minimum tax liability.

[10] Omission of social security benefits and certain other items is relatively unimportant for high-income taxpayers.

[11] In addition, income deferrals and accelerated expense deductions may also be involved in income or losses from rental property, from royalties, from partnerships, and from certain small business corporations, only the net amounts of which are included in adjusted gross income.

[12] For the sake of brevity, "investment interest to the extent that it does not exceed investment income" is called "investment interest." "Investment interest in excess of investment income" is called "excess investment interest."

[13] See footnote [9].

[14] The borderline between excess and non-excess investment interest depends on the income items actually included under each income concept. Hence, the investment interest adjustment differs depending on which income definition is used.

[15] Certain amounts of income earned abroad are excluded from adjusted gross income by statute. Any foreign taxes paid on such income are not creditable against U.S. income taxes. The tables in this section do not reflect either the amounts of income excluded or the tax payments on them.

[16] U.S. Congress, Joint Committee on Taxation, General Explanation of the Revenue Provisions of the Tax Equity and Fiscal Responsibility Act of 1982, December 31, 1982, p. 17.

[17] See pp. 16-23, Joint Committee on Taxation, op. cit., for a complete explanation of the minimum and alternative minimum taxes before and after TEFRA. Readers may also see the changes by comparing the appropriate income tax forms for 1982 and 1983: Form 4265 for 1982 and Form 6251 for both 1982 and 1983.

[18] The itemized deductions that could not give rise to tax preferences and the changes between 1982 and 1983 are summarized in the following chart. Under proper conditions, all other itemized deductions might produce tax preferences and some amount of alternative minimum tax.

Itemized Deductions That Cannot Generate Tax Preferences

<u>1982</u>	<u>1983</u>
Medical expense deduction ^{1/}	Medical expense deduction ^{1/} over 5 percent of adjusted gross income
State and local taxes	
Casualty losses	Casualty losses
	Charitable contributions
	Mortgage interest expense
	Investment and interest expense to the extent of investment income
	Gambling losses

^{1/} The itemized deduction for medical expenses consisted of the portion of medical expenses in excess of a floor of 3 percent of AGI (5 percent in 1983) for all medical costs, including the expenses for medicines and drugs in excess of a separate floor of 1 percent of AGI.

An Analysis of Partnership Activity, 1981-83

By Lowell Dworin*

The extensive marketing of "tax shelter" investments has caused many taxpayers to question the fairness of the tax system [1]. Because partnerships have frequently been used to conduct tax shelter activities, there has been considerable interest in examining the statistics on partnership income and losses. However, there are a number of reasons why previous Statistics of Income (SOI) data on partnership activity [2, 3] may not have fully revealed the impact of tax shelter activity.

TAXATION OF PARTNERSHIPS AND PARTNERS

There are two types of partnerships: general and limited. Tax shelter investors are more likely to acquire interests in limited partnerships, since doing so limits their exposure to the amount invested (or pledged under a letter of credit or other guarantee). As a result, aggregating the income and deductions reported by limited and general partnerships may somewhat mask the true picture of partnership tax shelter activity. Because no distinction had been made between these two types of partnerships in previous studies [2, 3], one objective of this article is to specifically examine the different patterns of deductions claimed and other aspects of their financial behavior.

Although a partnership is a legal entity, it is not taxed on the income it earns. Instead, the individual partners are generally taxed on their share of partnership earnings, whether they receive any actual partnership distributions. The partnership files an annual information return, Form 1065, with the Internal Revenue Service (IRS) and also provides a supplemental information schedule, Schedule K-1 (Form 1065), to each partner. The Schedule K-1 indicates the partner's share of the various items of partnership income, credits, deductions and other items so that the partner has the information necessary to complete his or her income tax return. A copy of each Schedule K-1 is provided with the Form 1065 filed with the IRS. An additional information schedule, Schedule K, which summarizes the information contained on the

individual Schedules K-1, is also provided with the Form 1065. (For 1983 and later years, however, if the partnership has 10 or fewer partners, it may elect not to file a Schedule K.)

In general, only by examining the items reported on the Schedule K (or separate Schedules K-1 if a Schedule K is not filed) can the tax consequences for the individual partners be determined. The net income reported on the Form 1065 represents only one component (although frequently the major component) of the income or loss reported by the partners.

Specifically, with reference to Table 1, partnership net income, which is the "bottom line" of the Form 1065, indicates the amount of "ordinary" income (or loss) to be allocated to the individual partners in accordance with their profit (or loss) sharing ratios (capital gains or losses are excluded). However, if items of income or expense are specially allocated to individual partners or are subject to special treatment by partners (such as capital gains), or are subject to special limitations or elections applicable at the partner level (such as investment interest expense or intangible drilling costs), they are not included in the net income reported on the Form 1065. Most of these items are reported instead on Schedules K-1 and K, but some, such as oil and gas depletion, are not reported on either the Form 1065 or Schedules K-1 or K. In short, the Form 1065 partnership net income or deficit does not necessarily reflect all of the partnership's income or deductions.

Thus, a second objective of this article is to use these Schedule K items, some of which were tabulated for 1983, to determine the tax benefits or costs that flow to the partners by virtue of their ownership of a partnership interest. These Schedule K items are also shown in Table 1. Because some items may not have been reported on either the Form 1065 or Schedule K, or may not have been available because no Schedule K was filed, it is not

*Taxation Specialist, Office of Tax Analysis, Department of the Treasury.

possible to compute the total income or loss incurred by the individual partners without use of some estimating procedures.

For this study, the most significant items that could not be directly determined, but that could be inferred from other available information, are those related to mineral extraction. In particular, oil and gas depletion, hard-mineral exploration and development costs, and intangible drilling costs (including dry hole costs) all had to be estimated and are indicated in Table 1. Although, in principle, the reported investment interest expense for 1983 should also be adjusted for partnerships with 10 or fewer partners that were not required to file a Schedule K, it was not possible to discern a consistent method for doing so. Therefore, this adjustment was not made. (The specific methods used to impute the mineral extraction costs are described below, under Data Sources and Limitations [4].)

In addition to the need to estimate certain items that were not included in the annual SOI studies of partnerships, certain other adjustments were also necessary for Table 1 in order to obtain an amount representing the contribution to taxable income reported by the partners as a result of partnership activities. Although guaranteed payments to partners are reported as a partnership expense on the Form 1065, they also represent income that must be reported by the partner (or partners) receiving such payments, and thus should be added back to the Form 1065 partnership net income to reflect more clearly the total income required to be reported by the partners. Also, a partnership may have income or losses through its ownership of interests in other partnerships. Since inclusion of such amounts would represent double counting of aggregate partnership income, these amounts (which generally are losses) should be deducted from the Form 1065 net income. Because the activities of partnerships that are classified as holding companies would be distorted if such income were eliminated, this adjustment was not made for this one industry (although it was made for all other industries and for the aggregate amounts noted).

GROWTH IN PARTNERSHIP ACTIVITY

Table 1 also provides summary statistics for partnerships for Tax Years 1981-83. The number of partnerships and the number of partners, both in total and by type of partnership (general or limited), are shown. Total assets and the partnership net income or deficit, together with the adjustments previously mentioned that are necessary to reflect the contribution to the taxable income reported by the partners with respect to their

partnership interests, are also noted. This table shows the overall level of partnership activity and the growth of such activity in recent years.

Data in the first three rows and columns of Table 1 are consistent with those previously published on partnerships [2, 3]. However, a more detailed separation into limited and general partnerships, and the additional data on items other than the Form 1065 partnership net income (and capital gain income) are new [5]. It may be noted from this table that whereas the number of partners in general partnerships remained fairly steady, the number of partners in limited partnerships, and the number of such partnerships, increased rapidly from 1981 to 1983. Indeed, despite the fact that for 1983 there were nearly six times as many general partnerships, there were more partners in limited partnerships than in general partnerships.

The adjustments noted were made to the partnership (Form 1065) net income or deficit to obtain amounts more reflective of the total taxable income that the partners had to report as a result of their ownership of partnership interests. (As already mentioned, the first adjustment consisted of subtracting the income reported as earned from their ownership of other partnership interests and adding back the guaranteed payments to partners.) For convenience, these adjustments also involved the subtraction of the estimated dry hole costs and non-oil and gas depletion reported on the Form 1065 so that these specific costs could be included with the estimated mineral exploration costs also shown in Table 1.

From the resulting "adjusted" partnership net income or deficit several additional adjustments were made. These essentially involved inclusion of those items of income or expense reported on Schedule K rather than on Form 1065. Because foreign source income and net losses from sales of partnership assets under Code section 1231 and specially allocated losses were not compiled for 1981 and 1982, the 1983 values were assumed for those years. Investment interest expense, which is the interest incurred to acquire or carry certain passive investment property, was not compiled for 1981, and thus the 1982 value (scaled to reflect the relative change in partnership long-term debt between 1981 and 1982) was used as a surrogate for the 1981 value. Because this approximation neglects the fact that interest rates were higher in 1981 than in 1982, it may understate the 1981 value.

As a result of these adjustments, an ordinary net income or deficit was obtained. To this income, 40 percent of the net long-term capital gains and section 1231 net

gains and specially allocated income were added to represent the portion of long-term gains taxable to partners and are included in "contribution to partner's taxable income before investment credit adjustment". Unfortunately, the section 1231 gains are not available for 1981 and 1982, and thus only the partnership "ordinary" net income or loss is shown for those years. ("Contribution to taxable income after investment credit adjustment" is the total effective taxable income that would have been reported by the partners if their share of the estimated investment credit earned by the partnership were expressed as an equivalent deduction, as described under Data Sources and Limitations.)

As may be noted from Table 1 and highlighted in Figure A, general partnerships in the aggregate appear to realize ordinary net income, while limited partnerships tend to incur losses. In addition though, for 1983, the net income of general partnerships clearly reflects the 1983 recovery from the 1980-82 recession [6]. In contrast, the losses of limited partnerships continued to grow, despite the 1983 upturn. It may also be noted that the estimated mineral exploration costs for both general and limited partnerships declined from 1981 through 1983. This largely reflects the cutback in oil and gas drilling activity over this period in response to the decline in oil prices [7].

The difference between the net income required to be reported by the partners and the Form 1065 partnership net income may be seen by comparing the ordinary net income or deficit with the partnership (Form 1065) net income or deficit amounts shown in Table 1. In general, the losses incurred by the partners in limited partnerships are seen to be somewhat greater than the Form 1065 net losses, while the profits incurred by the partners in general partnerships are somewhat greater than the partnership net income reported on the Form 1065 [8]. A similar correspondence between Form 1065 partnership net income and contribution to partner's taxable income after investment credit adjustment may be noted for 1983, which is the only year shown for which data on section 1231 net gains were actually available and the only year for which data were available to estimate the investment credit.

INCOME AND DEDUCTIONS BY INDUSTRY

In Table 2 the income and deductions reported by (or attributed to) partnerships for 1983 are disaggregated by the nature of the partnership activity. Summary statistics for most industrial divisions, and for each industrial group for which aggregate partnership losses exceeded \$100 million, are presented. The purpose of this table is to indicate the level of partnership activity across industries, as well as to indicate the relative magnitude of the interest, depreciation, mineral exploration costs, and all other partnership deductions, and investment credit equivalent for each industry. Thus, in addition to the estimated mineral exploration costs, ordinary net income or deficit, and investment credit adjustment noted in Table 1, more detailed information regarding the income and deductions reported by all partnerships for 1983 is provided in this table.

The ordinary gross income shown in column 1 of Table 2 represents the sum of business receipts less cost of sales and operations, gross rents, interest and dividend income, farm and royalty net income or loss, ordinary net gain from the sale of partnership assets, and other income reported on the Form 1065, plus ordinary net losses under section 1231 (which, for the most part, represent the depreciation recapture) and foreign source income reported on the Schedule K [9]. Income from "other" partnerships is excluded from the aggregate amount and from the partnership income reported for each industry (with the exception of partnerships classified as holding companies).

Interest expense, depreciation, and estimated mineral exploration costs (depletion, hard-mineral exploration and development costs, and intangible drilling costs, including dry hole costs) are presented in columns 2 through 4 of Table 2. The interest expense shown is the sum of the net interest reported on the Form 1065 (i.e., interest received minus interest deducted) and the investment interest expense reported on Schedule K, plus the separately reported rental interest expense. The depreciation expense shown is the sum of the depreciation deduction reported in the Form 1065 income statement and the additional depreciation on rental property as listed in the schedule in support of rental net income. The estimated mineral exploration costs are obtained as described under Data Sources and Limitations, below.

The deductions shown in column 5 of Table 2 include certain salaries and wages, rent, taxes, bad debts, repairs, rental expenses (other than interest and depreciation), and "other" deductions shown on the Form 1065. Cost of sales and operations, guaranteed payments to partners, interest expense, depreciation, depletion (other than oil and gas), and estimated dry hole costs are excluded. (Dry hole costs are included in mineral exploration costs.) The partnership ordinary net income or deficit is shown in column 6. As has already been noted, because some items of income and expense are not reported in the Form 1065 income statement, and because of the adjustments made for income from other partnerships and guaranteed payments to partners, the amounts shown in this column are not the same as those shown in the previously-published statistics on partnerships which present only Form 1065 income statement information [2, 3]. Nevertheless, the ordinary net income shown in this table for the industries noted does not differ appreciably from the partnership net income reported in the Bulletin article examining 1983 data [2] with one exception: oil and gas extraction for which a larger net deficit is indicated.

The total long-term capital gain shown in column 7 of Table 2 was approximated by combining the net long-term capital gains and section 1231 net gain reported on the Schedule K. By adding 40 percent of this amount to the amount shown in column 6, a rough estimate of the total contribution to the taxable income required to be reported by the partners can be made.

The estimated investment credit was derived from the cost of property eligible for the credit reported on schedules attached to Form 1065 and is shown in column 8 of Table 2. Using an effective individual tax rate of 24

percent for loss partnerships and 29 percent for net income partnerships, as obtained from an analysis of data from individual income tax returns, this estimated investment credit was converted to an equivalent deduction by dividing the amount of the credit by an average marginal tax rate. For example, a \$100 investment credit would shelter \$400 of taxable income for a taxpayer subject to a 25-percent tax rate. Subtracting this equivalent deduction (which, due to possible neglect of investment credit or net operating loss carryforwards, may be somewhat overstated) from the taxable income as obtained above, an effective total contribution to the taxable income "after credits" required to be reported by the partners is obtained, as shown in column 9 of this table. These numbers are not appreciably different from the Form 1065 net income with the exception of the oil and gas industry (for which the effective contribution to taxable income represents a greater loss than may be inferred from the Form 1065 net deficit [10]) and the real estate industry (for which the effective contribution to taxable income represents a smaller loss than the Form 1065 net deficit).

From Table 2 it may be seen that although partnerships may engage in all types of business activities, they appear to be especially active in oil and gas extraction, construction, wholesale and retail trade, land development, and services. As expected, mineral exploration costs (depletion and intangible drilling costs, including dry hole costs) are a major factor in oil and gas extraction while, among the specific deductions noted, depreciation and interest deductions play an important role in real estate operations. Depreciation is also important in oil and gas extraction and equipment leasing, while interest expense deductions are an important factor in holding and investment company activity.

PARTNERSHIP CHARACTERISTICS

Summary statistics of various partnership characteristics for 1983, including various measures of debt financing, are presented in Table 3 by industry and type of partnership. From Table 1 the income reported by limited and general partnerships was seen to differ. The purpose of Table 3 is to further explore the differences between these two kinds of partnerships. In particular, the business activity and the financing arrangements are compared. Note that the ratios shown in columns 7 and 8 in Table 3 are based on partnership debt and partners' capital account as reported for financial accounting purposes. Although partners' loss deductions are limited to their individual tax basis,

which thus cannot fall below zero, their capital accounts would fully reflect their shares of partnership losses, and could thus fall below zero. This would typically arise only in cases in which the partnership is heavily leveraged.

In some industries, such as manufacturing, construction, electric and gas services, and beef cattle (except feedlots), the fraction of partnerships operated as limited partnerships is relatively low. In contrast, in other industries, such as oil and gas extraction, real estate operators and lessors of buildings, and motion picture and video production, limited partnerships constitute a significant fraction of total partnerships.

The average number of partners in each limited partnership is much larger than the average number of partners in general partnerships in nearly all industries. Moreover, fewer limited partnerships report a "positive" net income than general partnerships. This, of course, is consistent with the fact (as noted in the discussion of Table 1) that, in the aggregate, general partnerships report profits while limited partnerships report losses.

From this table it can be seen that greater financial leverage is used in those industries in which the underlying assets may serve as security (such as real estate, motels and hotels, and equipment leasing). A greater fraction of nonrecourse debt (i.e., debt for which no partner is personally responsible) is used by limited partnerships, especially in the real estate industry. This may be explained by the fact that there are two separate limitations on a partner's ability to use the greater tax losses possible with debt financing. First, although a partner's tax basis in a general partnership (or a general partner's basis in a limited partnership) may include his or her share of partnership debt, this is not generally the case for a limited partner. A limited partner's basis may, however, include his or her share of the nonrecourse debt of the partnership. This, of course, encourages the use of nonrecourse debt by limited partnerships. Nevertheless, the benefit of such debt is greatly reduced for partners subject to the "at risk" limitation. (Individual taxpayers are generally only allowed to claim deductions related to their business or investment activities to the extent of the amount they are at risk for such activity.) Since, under current law, investment in real estate does not generally subject the partners to the "at risk" limitation, this method of financing is particularly attractive in this industry.

AGE OF PARTNERSHIPS

Table 4 shows how the various items of partnership income and expense vary by age of the partnership. The purpose of this table is to demonstrate that losses are usually incurred in the early years of the partnership, whereas profits are typically not realized until later in the partnership's life.

By examining the pattern of partnership receipts and expenses as a function of the age of the partnership, the temporal behavior of the taxable income that might be reported by the typical partnership may be inferred. The distribution of income and expense items by age of partnership is not, however, a perfect proxy for the actual temporal behavior of any individual partnership. Business cycles and secular economic growth cannot, of course, be captured. In order to adjust for the rapid growth in limited partnership activity, both the aggregate dollar amounts and the amount per partner are presented in Table 4.

From this table it may be seen that newly-formed partnerships (both limited and general) incur losses, whereas older partnerships realize positive income (or capital gains). However, the per partner losses appear to be somewhat greater for the limited partnerships than for the general partnerships. Moreover, per partner ordinary net income also appears to increase more rapidly with partnership vintage for general partnerships than for limited partnerships.

Although the single year's picture of the profits or losses reported by partnerships of varying vintage shown in Table 4 need not reflect the life cycle of the "typical" limited or general partnership, it is tempting to treat the per partner share of ordinary income and capital gains as if these amounts do in fact represent such profits or losses. If it is assumed that the pre-1973 partnerships noted in Table 4 were formed no earlier than 1969 (i.e., that partnerships have a 15-year life), then the sum of the per partner ordinary income and capital gains (without regard to the long-term capital gains exclusion) over each of the 15 years (as obtained from the per partner averages for partnerships of corresponding vintage) is found to be \$22,438 for limited partnerships and \$112,453 for general partnerships. To some extent, the greater cumulative per partner net income for general partnerships reflects the somewhat greater per partner total assets deployed (\$70,160 for limited partnerships and \$98,192 for general partnerships formed in 1983). Because taxable profits and losses need not represent economic

profits and losses (although, over the assumed 15-year "life" of the partnership, the cumulative amounts should not be too different), these results do not necessarily imply (though they strongly suggest) that investments in limited partnerships provide less economic benefits than investments in general partnerships.

DATA SOURCES AND LIMITATIONS

The data examined in this report are from three annual studies of partnership returns, for 1981 through 1983, carried out by the Statistics of Income (SOI) Division. For each year, the estimates were derived from probability samples stratified by combinations of receipts, total assets, net income (or deficit), and industry. Descriptions of the methodology used to obtain these data as well as analyses of them are available from previous issues of the SOI Bulletin [2, 3].

Some caveats must be noted with reference to the information presented in the tables. First, it has been assumed that Code section 1231 net gains reported by the partnership will ultimately be treated as long-term capital gains by the partners (and conversely that net section 1231 net losses will be treated as ordinary losses by the partners). Second, limitations imposed by the tax laws on the amount of partnership losses that may be claimed by a partner, such as that due to inadequate basis in his or her partnership interest, the limitation on losses (section 704 (d)), the "at risk" limitation (section 465), the investment interest expense limitation (section 163(d)), have all been ignored. Third, potential tax liabilities resulting from each partner's share of partnership tax preference items under the alternative minimum tax are ignored. Fourth, any gains or losses that must be reported by individual partners resulting from their receipt of partnership distributions or sale of their partnership interest are ignored. Finally, not all partners are individuals, and thus the use of a 60 percent exclusion for long-term capital gains and the use of effective individual tax rates to translate the tax benefits associated with the investment credit into a single statistic, the "contribution to partner's taxable income after investment credit adjustment", is not altogether valid.

The method of reporting certain items of partnership expense and income has varied. For a number of years oil and gas depletion has been computed at the partner level and so it has not been reported in either the Form 1065 income statement or in Schedule K. For the returns examined, a number of other items, including hard-mineral exploration and

development expenses and intangible drilling costs, were reported in Schedule K, but were not tabulated. (After 1983, intangible drilling costs are also not separately reported on either the Form 1065 or Schedule K.)

Although data on hard-mineral exploration and development costs and intangible drilling costs were not available, certain so-called tax preference items related to these costs were obtained from Schedule K. In particular, excess intangible drilling costs from oil, gas, or geothermal wells, net income from oil, gas, or geothermal wells, and "other" tax preference items were tabulated for partnerships filing a Schedule K.

To estimate intangible drilling costs attributable to successful wells, the reported excess intangible drilling costs were increased by an estimated 10 percent. This was to adjust for the fact that the reported "excess" amount under current law is net of the deduction for intangible drilling costs (that would have been claimed had these costs been capitalized and either amortized over 10 years or written off on a units-of-production basis). Although a 10-percent increase may overstate the adjustment, had 10-year amortization been used, it may understate the adjustment if a units-of-production method were used to calculate the excess intangible drilling costs.

The oil and gas depletion deduction was estimated as the lesser of 15 percent of the business receipts reported in the income statement, or 50 percent of the net income from oil, gas, and geothermal wells for those oil and gas partnerships that filed a Schedule K. This estimate is only approximate, because the net income from oil, gas, and geothermal wells does not take into account excess intangible drilling costs on productive property. It was thus implicitly assumed that such excess intangible drilling costs were incurred on nonproductive properties (and thus did not affect percentage depletion, which is computed on a property-by-property basis). It was also implicitly assumed that production from all productive properties would qualify for percentage depletion. (This would not be valid if the partnership acquired proven properties.) However, in some instances cost depletion might provide larger deductions than percentage depletion. Thus, while the estimate may overstate the actual percentage depletion claimed, the calculated deduction may provide a more accurate measure of the total depletion allowance (cost or percentage).

Since the excess intangible drilling costs may be obtained only for those oil and gas partnerships that filed a Schedule K, the

computed intangible drilling costs were "scaled up" by the ratio (1.575) of the "other" deductions for oil and gas partnerships to the "other" deductions reported in the Form 1065 income statement for those oil and gas partnerships that filed a Schedule K. Likewise, the percentage depletion for those oil and gas partnerships not filing a Schedule K was imputed by "scaling up" the computed depletion by the ratio (1.867) of the business receipts for all oil and gas partnerships to the business receipts reported by those oil and gas partnerships filing a Schedule K.

These adjustments, which were required to compensate for the fact that not all partnerships filed a Schedule K for 1983, were not necessary for 1981 and 1982. As a test of their accuracy, the relative magnitude of the 1981, 1982, and 1983 estimated intangible drilling costs were compared with the level of drilling activity in these years [7]. Despite the several assumptions, it was found that the pattern of computed intangible drilling costs matched nearly exactly the pattern of rotary rig activity and reported industry-wide drilling expenditures during those years.

In addition, dry hole costs (which should be reported in "other" deductions on the Form 1065) were taken to be three-sevenths of the intangible drilling costs incurred on successful wells. This is the 1982 industry-wide ratio of dry hole costs to the drilling costs of successful wells [11]. For convenience, these estimated dry hole costs were subtracted from "other" deductions reported on the Form 1065 and added to the estimated intangible drilling costs on successful wells. Because the ratio of dry hole costs to successful well costs is likely to be greater for partnership ventures than for the overall industry, the resulting estimated intangible drilling costs (including dry hole costs) would tend to understate the actual costs. This should offset the possible overstatement of the percentage oil and gas depletion claimed.

The hard-mineral depletion expense was obtained directly from the Form 1065. It was assumed that the hard-mineral exploration and development costs constitute the "other" tax preference reported on Schedule K by partnerships in the mining industry. These costs were found to be relatively minor in comparison with the corresponding depletion expense obtained directly from the Form 1065.

NOTES AND REFERENCES

[1] See, for example, Nelson, Susan, "Taxes Paid by High - Income Taxpayers and the

Growth of Partnerships," Statistics of Income Bulletin, Fall 1985, Vol. 5, No. 1. In this study, it was found that partnership losses are the principal means of offsetting the positive income of high-income individuals.

- [3] U.S. Department of the Treasury, Internal Revenue Service, Statistics of Income 1978-82, Partnership Returns, Internal Revenue Service, June 1985.
- [4] In previous Bulletin articles on partnership activity, it was assumed that some of these mineral extraction costs (especially intangible drilling costs) may have been included in "other" deductions on the Form 1065, notwithstanding tax form instructions to the contrary. Despite the (possible) validity of this assumption, the analysis described here expressly assumes that this is not the case.
- [5] Selected items for selected industries for limited partnerships have been previously presented in a prior Statistics of Income publication, for Tax Years 1979-1982 [3].
- [6] The temporal behavior of the net income reported by general partnerships (but not limited partnerships) matches rather closely the corresponding behavior of corporate profits.
- [7] Moore, W.D. III, "Drilling Stabilizes at Sustainable Level with Broad Improvement Due in 1985," OGJ Special Report, Oil and Gas Journal, Oct. 1, 1984, p. 104.
- [8] This is not the case for the general partnership gains for 1981. However, the assumed amounts (\$1.3 billion in foreign source income and \$0.6 billion section 1231 net gains or specially allocated items) are comparable in magnitude to the difference noted (\$0.9 billion) and may be in part responsible for the anomalous behavior observed for this year.
- [9] If the total of all section 1231 transactions leads to a net gain, the gain is treated as a long-term capital gain, while if the total represents a net loss, the loss is an ordinary loss.

[10] As already noted, it is possible that some partnerships may have reported intangible drilling costs as part of the "other" deductions shown in the Form 1065 income statement. To the extent this occurred, the losses shown for this industry may be somewhat overstated.

n.a.-Not available.

1/Includes partners that are corporations and partnerships, as well as individuals.

2/Represents either items reported in "other deductions" in the partnership income statement or reported only on Schedule K or K-1, Partner's Share of Income, Credits, Deductions, etc.

3/Contribution to partners' taxable income before investment credit adjustment equals ordinary net income plus 40 percent (representing the taxable portion) of the estimated total of net long-term capital gains including section 1231 net gains.

4/Contribution to partners' taxable income after investment credit adjustment equals ordinary net income plus 40 percent (representing the taxable portion) of net long-term capital gains including section 1231 net gains, less the investment credit adjustment divided by an average marginal tax rate (for individuals).

Table 2. Summary of 1983 Partnership Income and Deductions by Selected Industry
 [All figures are estimates based on samples -- money amounts are in millions of dollars]

N/A-Not applicable.

1/After reduction by cost of sales and operations and net income from other partnerships.

2/Includes estimated depletion (including amounts claimed on oil and gas), hard-mineral exploration and development costs, and intangible drilling costs (including dry hole costs).

3/Excludes deduction for guaranteed payments to partners.

4/Includes net long-term capital gains plus section 1231 net gains reported on Schedule K or K-1.

5/Estimated based on cost of property eligible for credit.

6/This is the contribution to partners' taxable income after investment credit adjustment.

7/Includes "Wholesale and Retail Trade, not allocable", and "Nature of Business not allocable", not shown separately.

8/Income and expenses from other partnerships.

Environmental Taxes, 1981-84

By Rashida Belal*

Through the calendar year ended December 1984, \$978 million in tax liability was reported by companies for environmental excise taxes. Of this amount \$642 million was for petrochemicals; \$172.2 million for inorganic chemicals, \$150.3 million for petroleum and petroleum products, and \$10.7 million for hazardous wastes.

In 1980, Congress created a major Federal program to clean the worst abandoned hazardous waste sites. The Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) provided for a 5-year clean-up program. Funds were to be accumulated through the Hazardous Substance Response Trust Fund portion of CERCLA, more commonly referred to as Superfund [1]. The tax rates of the "front-end tax" were formulated so that they produce \$1.6 billion over 5 years and the tax liability incurred for petroleum and chemicals would reflect the respective percentage in which they were found in hazardous waste sites (based on data available in 1980) [2].

REQUIREMENTS FOR REPORTING TAXES

Requirements for filing and reporting a tax on petroleum apply to the following:

1. Operators of U.S. refineries receiving crude oil;
2. Importers of petroleum products for consumption, use, or warehousing; and
3. Users or exporters of crude oil on which the environmental tax has been paid.

The requirements for filing and reporting the tax on chemicals apply to any importer, manufacturer, or producer that sells or uses any of the 42 taxable chemicals listed in Table 1. Since the tax is imposed only once on a product, once it has been paid it cannot be imposed again on another business that would otherwise be liable. There are some exceptions to what is taxed, with the following being nontaxable:

1. Ammonia, if used directly as a fertilizer;
2. Methane or butane used as a fuel (however, the business using the chemical for a taxable purpose is liable);
3. Nitric acid, sulfuric acid, ammonia, or methane used in the production of ammonia for fertilizer;
4. Sulfuric acid produced solely as a by-product of, and on the same site as, air pollution control equipment; and
5. Any substance derived from coal.

CERCLA, which contains the provisions for reporting liability against hazardous waste, also established the Post-closure Liability Trust Fund which includes the Hazardous Waste Tax. The Hazardous Waste Tax, "a waste-end tax," is imposed on the receipt of hazardous waste at a "qualified" hazardous waste disposal facility. The tax applies to any hazardous waste that will remain after the facility is closed. The tax took effect October 1, 1983 and will be in effect until the unobligated balance of the Post-closure Liability Trust Fund exceeds \$200 million.

As shown in Figure A, the largest share of taxes has been from petrochemicals. Tax liability reported for petrochemicals accounted for 66 percent of the total reported through December 1984. Inorganic chemicals represented 17 percent of the tax liability and petroleum and petroleum products accounted for 16 percent of tax liability.

It is interesting that, while the tax on petrochemicals accounted for 66 percent of total tax, it continued to be reported by the fewest number of businesses. As a result, these businesses had the highest average tax liability, more than \$2.5 million per company for petrochemicals. Inorganic chemicals, reported by 41 percent of the companies, ac-

*Foreign Special Projects Section. Prepared under the direction of Mike Alexander, Chief.

Figure A
Sources of Environmental Taxes,
Quarters Ending June 30, 1981,
through December 31, 1984

counted for an average tax of \$400,000 per company. In comparison, while petroleum and petroleum products were reported by 42 percent of the companies, the average tax was \$347,000 per company.

Number of Businesses and Amount of
Environmental Taxes for Quarters Ending
June 30, 1981 through December 31, 1984
[Money amounts are in thousands of dollars]

Type of tax	Number of businesses	Total tax	Average tax
	(1)	(2)	(3)
Total Environmental Tax	1,015	978,108 ¹	964
"Superfund"			
Petroleum	433	150,335	347
Petrochemicals	252	641,842	2,547
Inorganics	430	172,187	400
Post-closure Liability Trust Fund	122	10,703	88

¹Includes taxes not allocable to a specific category. For this reason and also because of rounding, detail will not add to total.

The number of companies reporting liability for hazardous wastes under the Post-closure Liability Trust Fund increased by 62 percent over 1983, from the 74 companies reported as of December 1983 to 122 companies as of December 1984. The average tax for that same period rose from \$23,000 to more than \$87,700.

Since the quarter ended June 1981, 1,015 companies reported liability for environmental taxes at least once and the average reported liability was \$963,000 per company. This picture warrants a closer inspection, however. The 40 companies reporting \$5 million or more in tax liability accounted for 78 percent of the tax. The 23 companies reporting \$10.5 million or more in tax liability averaged \$18.5 million in tax and were responsible for 65 percent of the total. But the lion's share of the tax was in fact reported by fewer than 1 percent of the reporting companies. The companies reporting \$20 million or more in tax liability accounted for more than 50 percent of the tax. These twelve top companies averaged more than \$40 million in environmental taxes.

The quarter ended June 1983 showed an increase for petroleum, petrochemicals and inorganic chemicals for the first time since the quarter ended June 1982. Total tax liability for the quarter ended December 1983 was \$68.6

"Superfund" Taxes by Category for Quarters
Ending June 30, 1981, through December 31, 1984

[Millions of dollars]

Quarter ending	Total	Petrochemicals	Inorganic chemicals	Petroleum

¹Includes taxes not allocable to a specific category. For this reason and also because of rounding, detail will not add to total.

million, up by almost \$4 million over the September 1983 figure. March 1984 figures showed an increase of \$17.3 million over March 1983 and almost \$8.5 million in tax liability over the quarter ended December 1983. Tax liability dipped slightly for the quarter ended June 1984 to \$75.6 million, a decrease of about \$1.4 million from the previous quarter. This was especially noteworthy since the second quarter has traditionally shown a rise because of the increase in chemical shipments to the agricultural and construction markets. The slide continued into the quarter ended September 1984, when tax liability dropped to \$66.0 million. The liability reported for the quarter ended December 1984 climbed back up to \$69.3 million; however, that amount was still more than \$7.7 million off the mark set in March 1984 [3] [4] [5].

PETROCHEMICALS

Two hundred and fifty-two companies, only 25 percent, reported tax for petrochemicals and those companies averaged \$2.5 million in petrochemical tax. The 47 companies that reported more than \$257 million in tax liability for ethylene averaged \$5.5 million. The next largest amount of liability, \$116 million, was reported for propylene. A total of 58 companies averaged \$2.0 million in liability for propylene. Naphthalene was reported by only 9 companies and the average tax reported was about \$135,000. Toluene, reported by the largest number of companies, 104, averaged \$412,000.

INORGANIC CHEMICALS

Tax on inorganic chemicals was reported by 430 companies or 42 percent of the companies reporting environmental taxes. Those companies reported an average of \$400,000 in tax for inorganic chemicals. Sulfuric acid was the single most reported chemical, reported by 26 percent of the companies. The average tax on sulfuric acid was \$82,000.

SUMMARY

Through the calendar year ended December 1984, \$978 million in liability was reported for environmental excise taxes. The largest share of taxes reported was from petrochemicals. This was by design, since rates were formulated so that liability per class of substance would reflect the percentage in which these substances were found in hazardous waste sites.

The Superfund portion of CERCLA expired September 30, 1985. The tax liability reported for hazardous waste reached \$11.5 million dol-

lars in Calendar Year 1984. This portion of CERCLA will remain in effect until the unobligated balance of the Post-closure Liability Trust Fund exceeds \$200 million or until it is repealed.

Since the quarter ended June 1981, 1,015 companies reported liability for environmental taxes at least once and the average reported liability was \$938,000 per company. However, the lion's share of the liability is, in fact, reported by fewer than 1 percent of the reporting companies. These top 12 companies accounted for more than 50 percent of the tax, an average of \$40 million in environmental tax per company.

DATA SOURCES AND LIMITATIONS

The Quarterly Excise Tax Return, Form 720, is the form on which environmental taxes are reported. Form 6627, Environmental Taxes, is the supporting schedule on which the tax liability for petroleum, chemicals and hazardous waste is computed. The tax as imposed by Congress is levied at different rates ranging from \$.0079 per barrel of crude oil or petroleum to as much as \$4.87 per ton of certain chemicals. The average tax levied is \$3.24 per medium.

Returns are due to be filed one month after the end of the quarter in which the business is liable for environmental taxes. These returns are the source of data for this study. Data in this article reflect information reported on returns filed for the tax quarters ending June 30, 1981, through December 31, 1984.

Any adjustments, credits, or refunds to environmental taxes on either the Form 720 or Form 843, Claim, are not reflected in the data. A taxpayer can take an adjustment or credit if a taxed chemical is later used to manufacture or produce any other substance subject to the tax. If a tax is paid on a chemical subsequently used to produce fertilizer, a credit or adjustment can also be claimed.

The Internal Revenue Service also releases environmental tax statistics in a report on excise taxes issued quarterly [6]. These figures, taken from the Form 720, show the total liability, after adjustment, on returns recorded on the computerized Business Master File as part of routine tax administration processing. There is, however, no distribution of tax by type of chemical. Returns are due one month after the end of the calendar quarter and are reflected in the statistics for the quarter in which they are filed (and processed). Also included are returns filed late because of routine filing extensions and other reasons. Therefore, that report covers whatever tax was recorded during a quarter, regard-

less of when it was incurred. Consequently, the two series of data are not directly comparable.

Since no statistical sampling was involved, the data are not subject to sampling error, but may be subject to nonsampling error. Although efforts were made to secure missing returns, some returns from previous quarters were substituted because of time and resource constraints. In addition, the returns were passed through a series of validity checks to verify the accuracy and completeness of the returns. For those returns supplying a total chemical tax with no distribution by category, the amount was included in the statistics under "unallocable chemicals."

Preliminary Individual Income Statistics, 1984

By Marshall S. Epstein and David Barker *

Adjusted gross income reported by individual income tax filers exceeded \$2 trillion for the first time for Tax Year 1984. This 11.1 percent increase in income led to an 11.0 percent increase in taxable income and a 10.9 percent increase in total income tax. This was the first increase in total income tax since implementation of the Economic Recovery Tax Act of 1981.

This and other information that was unavailable in time for inclusion in the Winter 1985-86 issue of the SOI Bulletin is presented in Table 1 by size of adjusted gross income. Among the new statistics for 1984 are itemized deductions by type. They show that the 15 percent increase in total itemized deductions reflected similar increases in the two predominant deductions, for interest and taxes paid. To assist the user of the data, the definitions and tax law changes and the descriptions of the data sources and limitations from the Winter issue are repeated below.

DEFINITIONS AND TAX LAW CHANGES

In general, the definitions of the terms used here are the same as those shown in the complete report, Individual Income Tax Returns 1983.

Following is a partial list of 1984 tax law and administrative changes that are reflected in the preliminary data in this article. Changes are listed in the same order as the topics are presented in this article.

- o Beginning with Tax Year 1984, a percentage of social security benefits (or tier 1 railroad retirement benefits) became taxable. The amount of benefits that had to be included in income was the lesser of half the benefits received for the year or half the excess of the taxpayer's modified AGI over a specified base amount. Modified adjusted gross income was the taxpayer's AGI plus the following:

- 1) any tax-exempt interest,

- 2) the two-earner married couple deduction,
- 3) the foreign earned income exclusion and the foreign housing deduction and
- 4) the exclusion for income from U.S. possessions and Puerto Rico.

The base amount that applied was \$25,000 for single persons, \$32,000 for married couples filing jointly, \$25,000 for married persons filing separately and not living with their spouse, and zero for married persons filing separately and living together.

- o Beginning with Tax Year 1984 contributions to IRA's could no longer be made after the due date for filing a return. Previously taxpayers could make contributions to their IRA until the due date for filing their return including any extensions.
- o The limit for excluding "reasonable" amounts of employer-provided foreign housing increased by \$263 to \$6,878 for 1984.
- o For Tax Year 1983, taxpayers could only deduct expenditures for prescription and over-the-counter products, including vitamins and minerals recommended by a doctor, greater than 1 percent of their AGI. The 1 percent floor was removed for Tax Year 1984. Offsetting this, starting with 1984 only prescription medicines and drugs and insulin were deductible.
- o Before Tax Year 1984, all casualty and theft losses exceeding \$100 were combined and only the portion of these losses in excess of 10 percent of AGI was deductible. For Tax Year 1984, casualty and theft gains were netted. The 10 percent casualty loss limitation still applied. However, net casualty and theft gains were treated as capital gains.

*Individual Returns Analysis Section. Prepared under the direction of Susan Hostetter, Chief

- Beginning with Tax Year 1984, taxpayers not itemizing their deductions could deduct up to \$75 (\$37.50 for married couples filing separately) for charitable contributions. For Tax Years 1982 and 1983, non-itemizing taxpayers could only deduct up to \$25 (\$12.50 for a married couple not filing a joint return).
- Features from the disability income exclusion and the credit for the elderly were combined into a new credit--the credit for the elderly and permanently and totally disabled. The following individuals qualified for the credit:
 - 1) taxpayers who were 65 or older, and
 - 2) taxpayers under 65 receiving taxable disability benefits who were retired on permanent and total disability and who had not reached the age for mandatory retirement. Prior law allowed taxpayers under 65 to claim the credit for the elderly if they received income from a public retirement system. For 1984, these individuals could only take the credit if they met the permanent and total disability requirement.
- Beginning with 1984, the investment credit, jobs credit, alcohol fuels credit, and employee stock ownership credit were combined into the general business credit. Separate limits based on tax liability and individual carryback and carryover provisions no longer applied to each credit. Instead, a single tax limit and carryback and carryover rule applied to the combined business credit.
- The 1984 Tax Table and Tax rate schedules reflected the final annual 10 percent tax cut mandated by the Economic Recovery Tax Act of 1981.
- "Income averaging" changed for Tax Year 1984. The base period was reduced from 4 years to 3. The base period encompasses the years closest to the current tax year. In order to "income average," taxpayers' current-year income had to exceed 140 percent of their average taxable income for the 3-year base period. Previously, taxpayers current income only had to exceed 120 percent of their average base period income.

DATA SOURCES AND LIMITATIONS

These preliminary statistics are based on a sample of individual income tax returns, Forms 1040, 1040A and 1040EZ, filed for Tax Year

1984. Returns in the sample were stratified based on the presence or absence of Schedule C, Profit (or Loss) from Business or Professions; Schedule F, Profit (or Loss) from Farms; the larger of total income or total loss, and the size of business plus farm receipts. For Tax Year 1984, returns were selected at rates ranging from 0.02 percent to 100 percent. There were 79,797 returns in the 1984 preliminary sample, estimating a total population of 99,604,975. The corresponding sample size and population for the preliminary 1983 data were 104,970 and 96,293,634, respectively. Sample size and population for the final 1983 data, referenced in this article, were 122,997 and 96,563,687, respectively.

Because the data presented in this article are estimates based on a sample of returns filed, they are subject to sampling error. To use properly the statistical data provided, the magnitude of the potential sampling error must be known. Coefficients of variation (CV's) are used to measure that magnitude.

The following table presents approximate coefficients of variation (CV's) for frequency estimates. The approximate CV's shown here are intended only as a general indication of the reliability of the data. For a number other than those shown, the corresponding CV's can be estimated by interpolation. The reliability of estimates based on samples, and the use of coefficients of variation for evaluating the precision of sample estimates based on samples, are discussed in the Appendix.

Number of Returns	Approximate Coefficient of Variation
40,438,600	.01
10,109,700	.02
1,617,500	.05
404,400	.10
101,100	.20
44,900	.30
33,000	.35
16,200	.50

These preliminary estimates are subject to several types of nonsampling reporting error. While the estimates are intended to represent the full year's taxpayer reporting, they are actually based on returns filed January through late September 1985. Returns filed after that (which were sampled for use in the revised estimates for the year) tend to have slightly different characteristics than those filed earlier. These characteristics include higher income, a larger proportion of investment income (such as capital gains), a higher average tax liability, and a larger proportion of certain other items such as the alternative minimum tax.

Individual Returns/1984

Table 1.— All Returns: Selected Income, Deduction, and Tax Items, by Size of Adjusted Gross Income

[All figures are estimates based on samples—money amounts are in thousands of dollars]

Crude Oil Windfall Profit Tax, Second Quarter 1985

By Edward Chung*

The Crude Oil Windfall Profit Tax Act of 1980 imposed a Federal excise tax on domestic crude oil extracted on or after March 1, 1980.

Tables 1 through 3 provide summary data for the second quarter of 1985 while Tables 4 through 6 give the cumulative results for the first half of 1985. Figures A and B, as well as Table 7, provide a historical perspective.

Please note that tier one (70 percent) Sadlerochit oil dropped from 88.5 million barrels in the first quarter of 1985 to 2.7 million barrels in the second quarter. This decline was primarily due to several oil companies, with significant amounts of production, reporting zero tax liability for this tier of oil.

DATA SOURCES AND LIMITATIONS

The windfall profit tax is reported on the Quarterly Federal Excise Tax Return, Form 720. Form 6047, Windfall Profit Tax, shows how the

tax is computed and is filed as an attachment to Form 720. Tabulations in this article are based on the Form 6047. Returns are due 2 months after the end of the quarter in which the oil is removed. Data are based on all returns with a tax liability of \$1 million or more before adjustments and a 10-percent sample of all other returns.

Sampling and nonsampling errors were controlled by a variety of methods. Although efforts were made to secure missing returns, some returns may have been omitted because of time and resource constraints. Attempts were made to correct imbalances in taxpayer entries for the components of windfall profit; if this proved impossible, an out-of-balance return was treated as a return on which the components were not reported, and therefore only the tax liability for each tier was tabulated. However, for returns not reporting the tax computation detail (for Figures A and D only), the components were estimated using a factor derived from the relationship of the tax

Figure A
Components¹ of Windfall Profit Tax Liability Before Adjustments:
Aggregate Values By Quarter Oil Removed

¹Some returns report windfall profit tax liability only; therefore, data for removal value, adjusted base value and state severance tax adjustment have been adjusted to reflect totals as if all returns reported this detail.

²One month only.

*Foreign Special Projects Section. Prepared with the assistance of Patricia Slaughter under the direction of Michael Alexander, Chief.

Figure B
Components of Windfall Profit Tax Liability:
Averages per Barrel by Quarter Oil Removed

NOTE: Because of price controls during 1980, there were cases where the removal price was less than the adjusted base price and no Form 6047 was filed. The data in the figure are based on information reported.

¹One month only.

liability for those reporting all of the tax computation detail. A number of verification checks were performed at all stages of manual data abstraction and computer tabulation.

The Statistics of Income Bulletin also includes data on excise tax collections. The excise tax collection figures show the liability after adjustments, as reported on Form 720, from returns entered into the Internal Revenue Service (IRS) computerized Business Master File (BMF) each quarter. A number of considerations affect comparisons of data from these two sources. Returns are not due until 2 months after the close of the taxable quarter; however, the interval between the close of the taxable period and the final recording of the return often varies, so that the quarterly BMF totals may represent more than one taxable period. On the other hand, the data presented here have been tabulated for specific taxable periods. As a result, the two sets of statistics are not directly comparable.

DEFINITIONS

Brief definitions of the terms used in the tables are given.

Adjusted Base Price.--The base price multiplied by the inflation adjustment, which is derived from the Gross National Product (GNP) "implicit price deflator."

Adjustments to Liability.--Corrections applied to the current quarter's liability to

correct for the net income limitation and over- and under-withholding in previous quarters.

Base Price.--For tier one oil, the upper tier ceiling price, as defined by Department of Energy price control regulations, which would have applied to the oil had it been produced and sold in May 1979, reduced by \$0.21. For tiers two and three oil, the base prices were \$15.20 and \$16.55, respectively, adjusted for grade and quality.

Crude Oil.--The term applies only to natural crude petroleum and does not include synthetic petroleum, such as oil from shale or tar sands. It does, however, include natural gas liquids treated as crude oil under the June 1979 energy pricing regulations issued by the Department of Energy.

Deposit Requirements.--The timing of any first purchaser to deposit amounts withheld depends on the identity of the first purchaser. Major refiners, other than independent refiners, are required to make semi-monthly deposits of the withholding tax. All other first purchasers are required to make withholding deposits no later than 45 days after the oil is removed from the premises, except independent refiners that purchase oil under delayed payments contracts. The latter are required to make deposits by the first day of the third month beginning after the month of removal.

Exempt Alaskan Oil.--Oil from a reservoir other than the Sadlerochit reservoir that has been commercially exploited by any well north of the Arctic Circle; and oil produced north of the divides of the Alaska and Aleutian Ranges, and at least 75 miles from the nearest point of the Trans-Alaskan Pipeline System.

Exempt Charitable Oil.--Oil produced from economic interests held by qualified charitable medical facilities, educational institutions, and child care organizations (as defined in Internal Revenue Code section 170), if such interests were held on January 21, 1980, and at all times thereafter; and oil produced from interests held by a church on January 21, 1980, if, before January 22, 1980, the net proceeds from such oil were dedicated to the support of a medical facility, educational institution, or child care facility.

Exempt Governmental Oil.--Oil produced from an economic interest held by a state or a political subdivision (including agencies and instrumentalities), the net income from which is used for public purposes.

Exempt Indian Oil.--Oil produced from mineral interests held by or on behalf of Indian tribes or individuals on January 21, 1980, which is one of the following: (a) production received by Indian tribes and individuals from Tribal Trust Lands (the title to such land is held by the United States in trust for the tribes); (b) production from land or mineral interests held by an Indian tribe eligible for services provided to Indians by the Secretary of the Interior; or (c) oil, the proceeds from which are paid into the U.S. Treasury to the credit of tribal or native trust funds pursuant to law. This exemption also applies to production of any Alaskan Native Corporation prior to 1991, including wholly-owned subsidiaries of such corporations.

Exempt Royalty Oil.--Qualified royalty owners are exempt from the windfall profit tax on two barrels of oil per day for each day of the calendar quarter for oil removed after December 31, 1981. For 1985 and thereafter, three barrels per day will be exempt.

Exempt Stripper Oil.--Oil removed from stripper wells may qualify for exemption from the windfall profit tax if the following conditions are met:

- (1) the oil must be removed from a stripper well property after 1982,
- (2) the oil must be extracted by an independent producer,
- (3) the oil must be attributable to the independent producer's working interest in the property, and

(4) the stripper well property must not be a property transferred by a nonindependent producer on or after July 23, 1981.

Net Income Limitation.--The windfall profit on a barrel of oil may not exceed 90 percent of the net income attributable to the barrel.

Net Revenue.--This equals the gross revenue from the windfall profit tax, or excise tax (excluding that amount attributable to U.S. government interests), less the reduction of income tax resulting from taxpayers claiming deductions for windfall profit tax paid. Figures presented in this report are the gross liabilities reported by the withholding agents on Form 6047 and are before the reductions mentioned above.

Removal Price.--Generally, the price for which a barrel of oil is sold. In some instances, a constructive sales price is used.

Sadlerochit Oil.--Crude oil production from the Sadlerochit reservoir in the Prudhoe Bay oil field in Alaska.

State Severance Tax Adjustment.--A tax imposed by a state with respect to the extraction of oil. The windfall profit is reduced by the amount by which the severance tax exceeds that which would have been imposed had the oil been valued at its adjusted base price.

Stripper Oil.--In general, oil from a property for which the average daily production per well has been 10 barrels or less for any consecutive 12-month period after 1972.

Tier One Oil.--All domestically-produced crude oil other than any oil classified in tier two or three, or explicitly exempted by law from the tax. This includes the bulk of domestic oil from reservoirs proven to be productive before 1979.

Tier Two Oil.--Any oil from a stripper well property within the meaning of the June 1979 Department of Energy pricing regulations and oil from a U.S. economic interest in a Naval Petroleum Reserve. Note that the Crude Oil Windfall Profit Tax Act of 1980 defined tier two oil as from a "National" Petroleum Reserve. This was amended to read "Naval" Petroleum Reserve by the Technical Corrections Act of 1982.

Tier Three Oil, Heavy Oil.--All crude oil (1) produced that had a weighted average gravity of 16.0 degrees or less on the American Petroleum Institute (API) scale, corrected to 60 degrees Fahrenheit, for the last month of production

before July 1979, or (2) oil from a property with a weighted average gravity of 16.0 degrees API or less, corrected to 60 degrees Fahrenheit, for the taxable period.

Tier Three Oil, Incremental Tertiary Oil.-- Production in excess of a base level on a property on which a qualified tertiary recovery project (one using one of several specific chemical, fluid or gaseous recovery methods to extract oil not recoverable using standard techniques) has been undertaken. The nonincremental oil (i.e., the amount of production up to the base level) remains in the otherwise applicable tier.

Tier Three Oil, Newly Discovered Oil.--Crude oil sold after May 31, 1979, and produced from (1) an outer continental shelf area for which the lease was entered into on or after January 1, 1979, and from which there was no production in Calendar Year 1978 or (2) an on-shore property developed after Calendar Year 1978.

Windfall Profit.--The excess of the removal price of the barrel of oil over the sum of the adjusted base price and the state severance tax adjustment.

General notations

N/A - Not applicable

n.a. - Not available

p - Preliminary

r - Revised

Table 1

- [1] Includes total itemized deductions, charitable contributions for nonitemizers, and zero bracket amounts on nonitemized returns.
- [2] Includes surcharge of \$2,018,078,000.
- [3] Includes credits not shown separately below.
- [4] For Tax Year 1983, the alternative minimum tax was revised and the minimum tax was abolished. The revised alternative minimum tax starting with 1983 covered many of the tax preference items that had previously been subject to the minimum tax. Also, the alternative minimum tax rate was increased. (For 1983 and 1984, data on the former minimum tax could be reported on prior-year returns processed during the current-year filing period).

SOURCE: Statistics of Income--Individual Income Tax Returns, appropriate years. Data are subject to sampling error. Tax law changes affect the year-to-year comparability of the data. See the specific Statistics of Income reports for a description of sampling error and of law changes.

Table 2

- [1] Includes exemptions for age and blindness.
- [2] Totals in Table 2 do not agree with Tables 1 and 3 because they were obtained from a different source. For purposes of Table 2:
- Number of returns by state include, in addition to Forms 1040, 1040A and 1040EZ filed by U.S. citizens and residents, Forms 1040NR filed by nonresident aliens, as well as self-employment tax returns used in Puerto Rico and certain U.S. territories and possessions.
 - "Total tax" liability includes total income tax plus tax from recomputing prior-year investment credit, tax applicable to Individual Retirement Arrangements (IRA's), self-employment

tax, social security tax on tip income, and certain other income-related taxes. Total tax is before reduction by earned income credit (see also footnote (c), below).

- c. Earned income credit, available to certain low-income workers, could result in a refund (1) if there was no "total tax" (as defined in footnote (b), above), in which case the full amount was refundable, or (2) if the credit exceeded "total tax," in which case the excess was refundable. The difference between columns 19 and 21 is the refundable portion.

Total tax (column 16) minus earned income credit (column 21) is the amount most comparable to total tax in Tables 1 and 3. The total tax which results from this subtraction differs from Tables 1 and 3 because it includes additional taxes (see footnote (b), above) and because earned income credit used to offset tax (column 21) also includes amounts offset against these additional taxes.

- [3] Includes, for example, returns filed from Army Post Office and Fleet Post Office addresses by servicemen and women stationed overseas; returns filed by other U.S. citizens abroad; and returns filed by residents of Puerto Rico with income from sources outside Puerto Rico or with income earned as U.S. Government employees.

NOTE: This table presents aggregates of all returns filed and processed through the Individual Master File (IMF) system during Calendar Year 1985. Data have not been edited for Statistics of Income purposes.

SOURCE: Internal Revenue Service, Software Division, IMF Returns Systems Branch.

Table 3

- [1] Includes income tax after credits and the additional tax for tax preferences, i.e., minimum tax and alternative minimum tax.
- [2] For many taxpayers in this size class includes additional tax for tax preferences not included in "taxable income."

SOURCE: Statistics of Income--Individual Income Tax Returns, appropriate years. Data are subject to sampling error. Tax law changes affect the year-to-year comparability of the data. See the specific Statistics of Income reports for a description of sampling error and of law changes.

Table 4

- [1] Includes breakeven businesses.

SOURCE: Statistics of Income--Sole Proprietorship Returns, appropriate years, and SOI Bulletin, Summer issues. Data are subject to sampling error. Tax law changes affect the year-to-year comparability of the data. See the specific Statistics of Income reports for a description of sampling error and of law changes.

Table 5

- [1] Total assets, total liabilities and partners' capital account are somewhat understated because not all partnership returns included a complete balance sheet.
- [2] Short-term debt is the abbreviated title given to mortgages, notes and bonds payable in less than 1 year.
- [3] Long-term debt is the abbreviated title given to mortgages, notes and bonds payable in 1 year or more. In addition, for Tax Year 1975, long-term debt included nonrecourse loans.
- [4] See footnote 4 Table 6, for changes in the comparability of the statistics for receipts and deductions starting with 1981. Also, statistics for interest received are combined with dividends beginning with 1982.
- [5] Beginning with 1981, represents the more all-inclusive amounts reported in depreciation computation schedules rather than the amounts reported as the depreciation deduction (plus depreciation identified in cost of sales and operations schedules).

SOURCE: Statistics of Income--Partnership Returns, appropriate years, and SOI Bulletin, Summer issues. Data are subject to sampling error. Tax law changes affect the year-to-year comparability of the data. See the specific Statistics of Income reports for a description of sampling error and of law changes.

Table 6

- [1] Size classes are based on business receipts, i.e., gross amounts from sales and operations, for industries except finance, insurance and real estate. For the latter industries, total receipts, which is the sum of business receipts and investment income, was used. For partnerships, see also footnote 3, below.
- [2] Includes returns with no receipts as defined in footnote 1.

- [3] Includes corporations with zero assets and liabilities.

- [4] Beginning with 1981, "total receipts" in Table 5 includes, in part, only the net income or loss from farming and rentals. Previously, "total receipts" included the gross receipts from farming and rentals and, if rental receipts were the principal source of total receipts, they were treated as "business receipts" for the statistics. To help minimize the break in comparability caused by this change in statistical treatment of farm and rental income, an effort was made for 1981-82 to include rental (though not farm) gross receipts in the receipts used for the size distribution in Table 6.

In Table 5, since only the net income or loss from farming and rentals was included starting with 1981, the deductions reported in computing these net incomes are excluded from the deduction statistics. For previous years, these deductions are reflected in the deduction statistics.

- [5] Prior to 1979, partnerships that had liquidated were assumed to have zero assets and liabilities, even if their balance sheets showed otherwise, and were included in the "under \$25,000" asset size class. Beginning with 1980, balance sheet data reported for liquidated partnerships were tabulated as reported and were included in the appropriate asset size classes.

SOURCE: Statistics of Income--Corporation Income Tax Returns, appropriate years, Statistics of Income--Partnership Returns, appropriate years, Statistics of Income--Sole Proprietorship Returns, appropriate years, and SOI Bulletin, Summer issues. Tax law changes affect the year-to-year comparability of the data. See the appropriate Statistics of Income reports for a description of sampling error and of law changes.

Table 7

- [1] Includes additional tax for tax preferences (minimum tax), tax from recomputing prior year investment credit and Personal Holding Company tax.

SOURCE: Statistics of Income--Corporation Income Tax Returns, appropriate years. Data are subject to sampling error. Tax law changes affect the year-to-year comparability of the data. See the appropriate Statistics of Income reports for a description of sampling error and of law changes.

Table 8

- [1] Net capital assets, except land, consists of depreciable, depletable, and intangible assets less accumulated depreciation, depletion and amortization.
- [2] Short-term debt is the abbreviated title given to mortgages, notes and bonds payable in less than 1 year. Long-term debt is the abbreviated title given to mortgages, notes and bonds payable in 1 year or more.
- [3] Consists of regular and alternative tax. Tax Year 1970 includes surcharge of \$784,437,000.

SOURCE: Statistics of Income--Corporation Income Tax Returns, appropriate years. Data are subject to sampling error. Tax law changes affect the year-to-year comparability of the data. See the appropriate Statistics of Income reports for a description of sampling error and of law changes.

Tables 9 and 10

- [1] Individual income tax collected includes that portion which was designated for the presidential election campaign fund by taxpayers on their returns. Also included is the fiduciary income tax collected (from estates and trusts). Fiduciary income tax collected was \$4.1 billion in 1985, \$2.9 billion in 1984, \$2.7 billion in 1983, and \$2.6 billion in 1982. Presidential election campaign designations amounted to \$34.8 million in 1985 and 1984, \$35.5 million in 1983, and \$39.0 million in 1982.
- [2] Corporation income tax collected includes the tax on "unrelated business income" of tax-exempt organizations. Unrelated business income tax collected was \$69.8 million (1985), \$50.0 million (1984), \$45.1 million (1983), and \$64.7 million (1982).
- [3] Excise taxes are imposed on selected products, services and activities, such as those on alcohol and tobacco products and the windfall profit tax on domestically-produced crude oil.
- [4] Employment taxes include payroll taxes levied on salaries and wages, such as social security, railroad retirement and unemployment taxes; plus the self-employment tax imposed on "self-employment income".

NOTES: Collections (or refunds) are those made during the time periods indicated, regardless

of the year or other period during which the tax liability was incurred (or to which the refund applied).

Collections represent the gross amounts before refunds and include amounts paid with the return; prior to filing the return (as applicable, income tax withheld by employers and estimated tax payments); and subsequent to filing the return (chiefly the result of initial return processing or of examination and enforcement activities). Collections also include interest and penalties.

Refunds result chiefly from tax overpayments determined at time of filing a return. Included are amounts subsequently determined as due the taxpayer as a result of an amended return or a claim for refund (including those produced by "net operating loss" and other carryback adjustments from future taxable years); or as a result of initial return processing or of examination and other activities. Individual income tax refunds are net of offsets under a law which requires IRS to act as collection agent for state welfare agencies so that these agencies can be reimbursed for the support they furnished through Aid to Families with Dependent Children (AFDC) programs. All refund data include interest paid by IRS.

Detail may not add to totals because of rounding.

SOURCE: Internal Revenue Service, Returns Processing and Accounting Division, Revenue and Accounting Branch.

Table 11

- [1] Includes a one-time tax of 5 cents per gallon on gasoline and 4 cents per gallon on gasoline imposed on inventories of dealers as of April 1, 1983. Taxes on lubricating oil were repealed effective January 5, 1983.
- [2] Effective January 1, 1984, taxes on tubes and tread rubber were repealed, and dealers holding taxable tires were assessed a one-time floor stock tax.
- [3] Effective January 7, 1983, the excise taxes on parts and accessories for trucks and buses, which are included in this classification, were repealed. Beginning with the quarter ending December 1983, motor vehicles are excluded.
- [4] Special fuels, total includes diesel and special motor fuels which were classified as miscellaneous excise taxes in 1970. Beginning with the quarter ending December 1983, motor vehicles are included.

- [5] Effective January 1, 1983, the excise tax increased from 1 percent to 3 percent.
- [6] The negative amounts are due to refunds of this tax under the United States - United Kingdom Income Tax Treaty, which provides for an exemption from the tax retroactive to January 1, 1975. Also, a similar United States - France treaty provides for an exemption retroactive to January 1, 1979.
- [7] This amount reflects adjustments made for prior quarters.

NOTES: For 1970 and 1975, the fiscal year was defined as July of the previous calendar year through June of the year noted. For 1980-84, the fiscal year was defined as October of the previous calendar year through September of the year noted.

Additional detail is published in the Annual Report of the Commissioner and Chief Counsel, Internal Revenue Service.

SOURCE: Internal Revenue Service, Returns Processing and Accounting Division, Revenue and Accounting Branch.

Table 12

- [1] Includes Forms 1040C, PR and SS.
- [2] Includes Form 1041A in 1970 and 1975.
- [3] Included in totals, but not in the detail are Forms 990C, 4720, and 5227.
- [4] Includes Form 990A in 1970.

SOURCE: Internal Revenue Service, Research Division, Projections and Forecasting Group.

Table 13

- [1] 1984 projections are based on converting 1984 Taxpayer Usage Study sample (TPUS) to the equivalent of the Statistics of Income (SOI) sample. This was done because the TPUS sample represents returns filed through April, while the SOI sample represents all individual income tax returns filed for a calendar year. For additional information about the TPUS sample, see the Summer 1985 issue of the SOI Bulletin.

- [2] Data on IRS Taxpayer Service Programs are collected on a fiscal-year basis. In general, assistance rendered in a given fiscal year may be related to returns due on April 15th during the fiscal year and are for the tax year ending with the previous December. Therefore, data in Table 13, which are presented on a tax year basis are actually for a fiscal year, e.g., data shown as for Tax Year 1982 are actually for Fiscal Year 1983.

NOTE: Data on IRS assistance represent taxpayer contacts. Some taxpayers make more than one contact. The number of taxpayers assisted (in contrast to the number of contacts made) is not known.

SOURCE: Data on paid preparers obtained from Statistics of Income and Taxpayer Usage Study samples. Data on IRS assistance were compiled by the Taxpayer Service Division.

Appendix*

General Description of Statistics of Income Sample Procedures and Data Limitations

This appendix discusses typical sampling procedures used in most Statistics of Income (SOI) programs. Aspects covered briefly include sampling criteria, selection techniques, methods of estimation, and sampling variability. Some of the nonsampling error limitations of the data are also described, as well as the tabular conventions employed.

Additional information on sample design and data limitations for specific SOI studies can be found in the separate SOI reports (see References). More technical information is available, upon request, by writing to the Director, Statistics of Income Division, Internal Revenue Service, Washington, DC 20224.

SAMPLE CRITERIA AND SELECTION OF RETURNS

Statistics compiled for the SOI studies are generally based on stratified probability samples of income tax returns or other forms filed with the Internal Revenue Service (IRS). The statistics do not reflect any changes made by the taxpayer through an amended return or by the IRS as a result of an audit. The samples are based on such criteria as: industry, presence or absence of a return form schedule, accounting period, state from which filed and various income factors or other measures of economic size (such as total assets in the case of corporations).

The probability of a return being designated depends on its sample class or stratum and may range from a fraction of 1 percent to 100 percent. Considerations in determining the selection probability for each stratum include the number of returns in the stratum, the diversity of returns in the stratum, and interest in the stratum as a separate subject of study. All this is subject to constraints based on the allowable total cost or predetermined size of the total sample for the program.

For most SOI studies, returns are designated by computer from the IRS Master File based on the taxpayer identification number (TIN) which

is either the social security number (SSN) or the employer identification number (EIN). A fixed and essentially random number is associated with each possible TIN. If that random number falls into a range of numbers specified for a return's sample stratum, then it is selected and processed for the study. Otherwise it is counted (for estimation purposes) but not selected. In some cases, the TIN is used directly by matching specified digits of it against a predetermined list for the sample stratum. A match is required for designation.

Under either method of selection, the TIN's designed from one year's sample are for the most part selected for the next year's, so that a very high proportion of the returns selected in the current sample are from taxpayers whose previous years' returns were included in earlier samples. This longitudinal character of the sample design improves the estimates of change from one year to the next.

METHOD OF ESTIMATION

As noted above, the probability with which a return is selected for inclusion in a sample depends on the sampling rate prescribed for the stratum in which it is classified. Weights are, in general, computed by dividing the count of returns filed for a given stratum by the count of sample returns for that same stratum. "Weights" are used to adjust for the various sampling rates used--the lower the rate, the larger the weight.

The data on each return in a stratum are then multiplied by that weight. To produce the tabulated estimates, these weighted data are summed to produce the published statistical totals.

SAMPLING VARIABILITY

The particular sample used in a study is only one of a large number of possible random samples that could have been selected using the

*Compiled by Bettye Jamerson, Coordination and Publications Staff, under the direction of Robert Wilson, Team Leader. Major contributions were made by Paul McMahon, Corporation Statistics Branch, Operations Section.

same sample design. Estimates derived from the different samples usually vary. The standard error of the estimate is a measure of the variation among the estimates from all possible samples and is used to measure the precision with which an estimate from a particular sample approximates the average result of the possible samples. The sample estimate and an estimate of its standard error permit the construction of interval estimates with prescribed confidence that this interval includes the actual population value.

In SOI reports the standard error is not directly presented. Instead, the ratio of the standard error to the estimate itself is presented in decimal form. This ratio is called the coefficient of variation (CV). The user of SOI data may multiply an estimate by its coefficient of variation to recreate the standard error and to construct confidence intervals.

For example, if a sample estimate of 150,000 returns is known to have a coefficient of variation of 0.02, then the following arithmetic procedure would be followed to construct a 68 percent confidence interval estimate:

$$\begin{array}{r}
 15,000 \quad (\text{sample estimate}) \\
 \times 0.02 \quad (\text{coefficient of variation}) \\
 = 3,000 \quad (\text{standard error of estimate}) \\
 \\
 150,000 \quad (\text{sample estimate}) \\
 + \text{ or } - 3,000 \quad (\text{standard error}) \\
 = 147,000-153,000 \quad (68\% \text{ confidence interval})
 \end{array}$$

Based on these data, the interval estimate is from 147 to 153 thousand returns. A conclusion that the average estimate of the number of returns lies within an interval computed in this way would be correct for approximately two-thirds of all possible similarly selected samples. To obtain this interval estimate with 95 percent confidence, the standard error should be multiplied by 2 before adding to and subtracting from the sample estimate. (In this particular case, the resulting interval would be from 144 to 156 thousand returns.)

Further details concerning confidence intervals, including the approximation of CV's for combined sample estimates, may be obtained on request by writing the Director, Statistics of Income Division.

Generally in the SOI Bulletin only conservative upper limit CV's are provided for frequency estimates. These do, however, provide a rough guide to the order of magnitude of the sampling error.

NONSAMPLING ERROR CONTROLS AND LIMITATIONS

Although the previous discussion focuses on sampling methods and the limitations of the

data caused by sampling error, there are other sources of error that may be significant in evaluating the usefulness of SOI data. These include taxpayer reporting errors, processing errors, and effects of an early cut-off of sampling. More extensive information on nonsampling error is presented in SOI reports, when appropriate.

In transcribing and tabulating the information from the returns or forms selected for the sample, checks are imposed to improve the quality of the resultant estimates. Tax return data may be disaggregated or recombined during statistical "editing" in order both to improve data consistency from return to return and to achieve definitions of the data items that are more in keeping with the needs of major users. In some cases not all of the data are available from the tax return as originally filed. Sometimes the missing data can be obtained through field followup. More often though, they are obtained through imputation methods. As examples, other information in the return or in accompanying schedules may be sufficient to enable an estimate to be made; prior-year data for the same taxpayer may be used for the same purpose; or data from another return for the same year that has similar characteristics may be substituted. Research to improve methods of imputing data that are missing from returns continues to be an ongoing process [1].

Quality of the basic data abstracted from the returns is subjected to a number of quality control steps including 100-percent key verification. The data are then subjected to many tests based on the structure of the tax law and the improbability of various data combinations. Records failing these tests are then subjected to further review and any necessary corrections are made. In addition, the Statistics of Income Division in the National Office conducts an independent reprocessing of a small subsample of statistically-processed returns as a further check.

Finally, before publication, all statistics are reviewed for accuracy and reasonableness in light of provisions of the tax laws, taxpayer reporting variations and limitations, economic conditions, comparability with other statistical series, and statistical techniques used in data processing and estimating.

TABULAR CONVENTIONS

Estimates of frequencies and money amounts that are considered unreliable due to the small sample size on which they are based are noted by an asterisk (*) to the left of the data item(s) in the tabulations. The presence of an asterisk indicates that the sample rate is less than 100 percent of the population and there are fewer than 10 sample observations available for estimation purposes.

A dash in place of a frequency or amount indicates that no sample return had that characteristic. In addition, a dash in place of a coefficient of variation for which there is an estimate indicates that all returns contributing to the estimate were selected at the 100-percent rate.

Whenever a weighed frequency in a data cell is less than 3, the estimate is either combined with other cells or deleted in order to avoid disclosure of information about individual taxpayers or businesses [3]. These combinations and deletions are indicated by a double asterisk (**).

NOTES

- [1] For an example of the recent SOI Division research, see Hinkins, S., "Matrix Sampling and the Effects of Using Hot Deck Imputation," in 1984 Proceedings: American Statistical Association, Section on Survey Research Methods p. 245. Other research efforts are included in Statistical Uses of Administrative Records: Recent Research and Present Prospects, Volume 1, pages 179-184, Internal Revenue Service, March 1984.
- [2] Quality control activities for all SOI studies will be published in a series of

forthcoming reports. These reports will provide detailed information relating to quality in all phases of SOI processing.

- [3] In the case of geographic statistics, steps to avoid disclosure are taken when a weighted frequency is less than 10.
