

Individual Income Tax Returns, Preliminary Data, 1994

by *Therese M. Cruciano*

For Tax Year 1994, taxpayers filed 116.1 million U.S. individual income tax returns, an increase of 1.5 million returns, or 1.3 percent, from the number filed for 1993. Between 1993 and 1994, adjusted gross income less deficit (AGI) increased 5.0 percent to over \$3.9 trillion, more than twice the growth rate that occurred between 1992 and 1993. Taxable income rose 5.9 percent to nearly \$2.6 trillion, while total income tax increased 6.2 percent to over \$532.3 billion. The average tax rate for 1994 rose slightly to 13.6 percent of AGI, compared to 13.5 percent for 1993. However, except for taxpayers in two of the four highest income size classes in the statistics, the average tax rate for 1994 either declined or remained the same.

Between 1993 and 1994, the consumer price index (CPI-U) grew at an annual rate of 2.6 percent [1]. In contrast to 1993, the growth of both aggregate AGI and aggregate salaries and wages was greater than the rate of inflation. In addition to the 4.9 percent growth in salaries and wages, other income items showed substantial increases, thereby contributing to the growth of AGI. Notably, taxable distributions from Individual Retirement Arrangements and partnership and S Corporation net income (less loss) increased, 22.0 percent and 19.3 percent, respectively. Unemployment compensation continued to decline, as did the national unemployment rate. For 1994, the amount of unemployment compensation in AGI decreased 27.1 percent. In large part due to changes in law, the total earned income credit increased 36.2 percent, and taxable social security benefits increased 57.0 percent.

The comparisons of data for Tax Years 1993 and 1994 in this article are based on the preliminary estimates for both years [2]. A few income and tax items tend to be understated in preliminary estimates; therefore, comparisons based on preliminary estimates for one year and final estimates from previous years could be misleading. Comparisons based entirely on preliminary estimates both reduce the likelihood of misinterpretation of the data and afford a more accurate representation of year-to-year change. Final statistics for Tax Year 1993 are available in the historical tables at the end of this issue of the *Bulletin*.

Adjusted Gross Income, Taxable Income, and Total Income Tax

AGI grew at a lower annual rate than taxable income for 1994--5.0 percent versus 5.9 percent (Figure A). How-

ever, growth rates for both AGI and taxable income were significantly higher than the corresponding rates for 1993 of 2.3 percent and 2.2 percent, respectively [3]. Total income tax increased by 6.2 percent, 0.9 percentage points higher than for 1993. The alternative minimum tax (AMT) rose 5.5 percent for 1994.

Average AGI reported on 1994 individual income tax returns was \$33,658, representing a growth of \$1,169, or

Income tax increased 6.2 percent to \$532.3 billion; the "earned income credit" increased 36.2 percent to \$21.2 billion, due in large part to a change in law.

3.6 percent, over the amount for 1993; in contrast, average AGI for 1993 grew \$494 to \$32,489, or a 1.5 percent increase from 1992. Average taxable income for 1994 equaled \$27,897, up \$936 (or 3.5 percent) from the 1993 amount of \$26,961, (which,

in turn, grew \$594, or 2.3 percent, over the amount for 1992). In addition, average total income tax for 1994 grew \$269 (or 4.6 percent) to \$6,065 per taxable return, in contrast to the \$319 increase (or 5.8 percent) to \$5,796 per taxable return for 1993 [4].

The average tax rate for 1994 (i.e., total income tax divided by AGI reported on *all* returns, taxable and nontaxable) was 13.6 percent, only 0.1 percentage point more than for 1993 (Figure B). In the statistics, all income size classes except two had average tax rates that were the same as, or 0.1 percentage point lower than, for 1993. Of the two income size classes showing increases, the average tax rate for the "\$100,000 under \$200,000" class rose 0.1 percentage point, while the average tax rate for the "\$500,000 under \$1,000,000" class increased 0.2 percentage points. The constant or lower average tax rates for 1994 were mainly the result of inflation indexing of the size of the standard deduction, the size of the deduction for personal exemptions, and the width of the tax rate brackets.

Selected Sources of Income

The largest component of AGI, salaries and wages, rose \$141.0 billion, or 4.9 percent, for 1994 (Figure C). Business or profession net income (less loss) increased 4.7 percent. Both salaries and wages and business or profession net income (less loss) grew by more than the 2.6 percent rate of inflation for 1994. However, the growth rates of these two items were notably less than the 6.2 percent growth rate for the Gross Domestic Product [5].

Taxable income from pensions and annuities, the second largest component of AGI, increased 6.5 percent,

to \$208.2 billion. The largest percentage increase of any income item was for taxable social security benefits which increased 57.0 percent to \$39.4 billion. Much of this increase can be attributed to the change in law which required up to 85 percent of social security benefits to be included in taxable income for 1994. This percentage represents an increase from the maximum of 50 percent

for 1993 and prior years. (See the Definitions and Changes in Law section of this article for an explanation of taxable social security benefits). Unemployment compensation declined 27.1 percent to \$20.2 billion, the lowest level since 1990, reflecting the comparatively low unemployment rate (6.1 percent) for 1994 [6]. Other income items with large percentage increases were taxable Indi-

n.a. - Not available.

¹ Sources of adjusted gross income shown are incomplete and, therefore, do not add to total adjusted gross income.

² Includes capital gain distributions not reported on Schedule D.

³ Percentage not computed.

⁴ Includes farm rental income less loss.

⁵ "Other net income (less loss)" represents only data reported on the residual line on Form 1040, and does not include the foreign-earned income exclusion.

vidual Retirement Arrangement (IRA) distributions which increased 22.0 percent to \$33.1 billion, and partnership and S Corporation net income (less loss) which increased 19.3 percent to \$112.5 billion.

Interest rates remained relatively low during 1994, and taxable interest declined 5.1 percent to \$120.6 billion. This decline made Tax Year 1994 the fourth consecutive year for which taxable interest decreased.

Excluded from Figure C are "statutory adjustments," which are subtracted in the computation of AGI (see the Statutory Adjustments section of this article).

"Total positive income" (TPI) differs from AGI in that it includes only the positive income line items from individual tax returns [7]. For 1994, TPI grew 4.9 percent, to \$4.1 trillion (Figure D). TPI is particularly useful when examining percentage changes in income items which can have either positive or negative results, i.e., a gain or loss, such as estate and trust income, rent and royalty income, and farm income, that are relatively similar in size. This is because the netting effect tends to camouflage the separate gains and losses which can be quite substantial [8]. Major increases included estate and

trust net income which increased 16.2 percent to \$5.2 billion, and partnership and S Corporation net income which rose 14.4 percent to \$141.8 billion.

Losses

In contrast to total positive income, total negative income includes only the negative income line items from individual tax returns. Total negative income, i.e., net loss, included in AGI increased for 1994 by 4.1 percent to \$144.0 billion (Figure E). "Other net loss," representing the total amount (including positive amounts) reported on the "all other" residual income line of Form 1040 (excepting the foreign-earned income exclusion), was responsible for 25.0 percent of the total and showed a 4.5 percent increase. The "net operating loss carryforward" accounted for 94.0 percent or \$33.9 billion of "other net loss." The second largest component of total net loss, partnership and S Corporation net loss, decreased 1.4 percent to just over \$29.2 billion. The largest dollar amount change occurred in farm net loss, which increased \$2.6 billion to \$15.4 billion. The largest percentage change was for net capital loss, which increased 29.4 percent to \$10.3 billion for 1994.

NOTE: Detail may not add to totals because of rounding.

Statutory Adjustments

Statutory adjustments to total income increased 5.9 percent, from \$35.9 billion for 1993 to \$38.0 billion for

1994 (Figure F). The largest of all statutory adjustments was the deduction for one-half of self-employment tax, representing 33.4 percent of the total. This deduction

⁴ Percentage not computed.

increased 9.1 percent, mostly because of an increase in the amount of self-employment income subject to the Medicare portion of self-employment tax. The ceiling on the amount of self-employment income subject to the Medicare tax was eliminated for 1994. The self-employed health insurance deduction expired in 1993 and was not restored until April 1995. Therefore, taxpayers who wished to take the deduction but had already filed their 1994 returns, had to file an amended return. However, amended returns are not reflected in these statistics. (See the Definitions and Changes in Law section of this article for further explanation of the changes to the deductions for self-employed health insurance and self-employment tax.) Deductible payments to Individual Retirement Arrangements, despite a continued downward trend which began with 1986, accounted for 22.2 percent of all statutory adjustments.

The deduction for moving expenses was available for all taxpayers as a statutory adjustment for 1994, rather than as an itemized deduction. Comparing the 1993 deduction and the 1994 adjustment (and 1994 deduction for prior-year moves), the number of taxpayers claiming moving expenses increased 14.3 percent, while the amount of the expenses declined 50.7 percent. This decrease in the amount of moving expenses claimed may be attributed to the changes in law which eliminated the deductibility of several expenses previously allowed (see the Definitions and Changes in Law section of this article).

Deductions

The aggregate amount of all standard deductions claimed on 1994 individual income tax returns, i.e., the basic

standard deduction plus the additional standard deduction for age or blindness, increased 4.2 percent to \$399.2 billion (Figure G). Total deductions, the sum of the standard deductions and total itemized deductions (after limitation), equaled \$881.8 billion, an increase of only 2.1 percent. Since taxable income is the result of AGI less deductions and exemptions, this relatively small increase in total deductions resulted in a larger increase in taxable income. (See the Definitions and Changes in Law section of this article for a definition of the itemized deduction limitation.)

The number of returns claiming a standard deduction increased 1.6 percent for 1994, accounting for 70.9 percent of all returns filed and 45.3 percent of the total deductions amount. The 1994 average standard deduction equaled \$4,851, up \$121 from the average for 1993. The increase was largely due to inflation indexing of the standard deduction amounts.

Itemized deductions were claimed on 28.3 percent of all returns filed and represented 54.7 percent of the total deductions amount. The average total for itemized deductions (after limitation) equaled \$14,668, down \$25 from the average for 1993. (The remaining 0.8 percent of the returns did not claim either standard or itemized deductions because there was no AGI on these returns.)

Total itemized deductions (before limitation) increased 0.6 percent for 1994. Interest paid constituted the largest portion (38.7 percent) of the total, with home mortgage interest accounting for 95.3 percent of total interest paid. The remaining portion of interest paid was divided between investment interest and deductible points paid on a mortgage. The home mortgage interest deduction decreased 1.6 percent from the 1993 amount. The taxes paid

Total standard deduction.....	81,014	383,231	82,290	399,215	4.2
Total deductions (after itemized deduction limitation).....	113,708	863,586	115,192	881,835	2.1

¹ Returns with no adjusted gross income are not included in the deduction counts. For this reason, the sum of the number of returns with total itemized deductions and the number of returns with total standard deduction is less than the total number of returns for all filers.

² Includes investment interest and deductible mortgage "points" not shown separately.

³ Amount shown is for moving expenses incurred in years prior to 1994, but reported on 1994 returns.

⁴ Percentage not computed.

deduction increased 3.3 percent, to comprise 35.0 percent of total itemized deductions (before limitation), while the deduction for charitable contributions increased only 2.6 percent, less than half the rate of the increases seen in recent years. The change in law requiring written acknowledgment of contributions over \$250 may account for the "modest" increase for 1994. The moving expenses deduction is for expenses incurred in prior years. All current-year moving expenses were deducted from gross income as a statutory adjustment.

The AGI threshold for the limitation of itemized deductions increased to \$111,800 (\$55,900 if married filing separately) for 1994. Due to this limitation, higher-income taxpayers were unable to deduct \$12.9 billion in itemized deductions, a 3.7 percent increase from the 1993 amount.

Tax Credits

Total tax credits rose 6.4 percent, or \$0.5 billion, for 1994 to \$8.4 billion. The change was primarily a result of the large increase in the earned income credit (used to offset income tax before credits) (Figure H). The general business credit and the credit for prior-year minimum tax also increased considerably for 1994. However, a large portion of the increases was offset by decreases in three other credits (the child care credit, the credit for the elderly or disabled, and the foreign tax credit). Despite a 19.5 percent increase in the number of returns claiming

the foreign tax credit, the total amount of this credit decreased 6.3 percent.

The portion of the earned income credit (EIC) used to offset income tax before credits increased 21.4 percent for 1994, nearly twice the increase for 1993. The largest part of the EIC was the refundable portion, which was treated as a refund and paid directly to taxpayers who had no tax against which to apply the credit, or whose EIC exceeded income tax (and other taxes, such as the self-employment tax). The refundable portion of the EIC totaled \$16.7 billion for 1994, an increase of 38.3 percent from 1993.

The EIC changed significantly for 1994. For the first time, taxpayers without eligible children could qualify for the credit, provided they were between the ages of 25 and 64, had earned income, and their earned income and AGI were each less than \$9,000. In addition, the structure of the credit changed with the elimination of both the health insurance credit and the extra credit for a child born during the year. Only the basic credit part of the computation from 1993 remained. Moreover, for 1994 the income eligibility level was increased for taxpayers with two or more qualifying children. This change allowed taxpayers with two or more qualifying children to have a higher income than taxpayers with only one qualifying child and still be eligible for the EIC. Previously, there was only one income eligibility level for all taxpayers (see the Definitions and Changes in Law section of this article for details).

Figure H

Selected Tax Credits, Tax Years 1993 and 1994

[Number of returns is in thousands--money amounts are in millions of dollars]

Item	1993 (preliminary)		1994 (preliminary)		Percentage increase in amount
	Number of returns	Amount	Number of returns	Amount	
	(1)	(2)	(3)	(4)	
Total tax credits ¹	13,180	7,922	15,041	8,429	6.4
Child care credit.....	6,060	2,550	6,001	2,518	-1.3
Earned income credit ²	6,135	2,304	7,789	2,798	21.4
Credit for the elderly or disabled.....	220	48	213	46	-4.2
Foreign tax credit.....	1,292	2,116	1,544	1,982	-6.3
General business credit.....	245	517	287	598	15.7
Credit for prior-year minimum tax.....	56	217	67	314	44.7

¹ Includes credits not shown separately.

² Represents portion of earned income credit used to offset income tax before credits. Additional earned income credit amounts were used to offset other taxes (\$1.2 billion for 1993 compared to \$1.7 billion for 1994), and some amounts were either refundable or paid directly to the taxpayer (\$12.1 billion for 1993 compared to \$16.7 billion for 1994).

The total earned income credit increased 36.2 percent to \$21.2 billion for 1994 (Figure I). When returns without qualifying children were excluded (making the data comparable to 1993), the amount of EIC reported rose 31.8 percent, yet the number of returns decreased 1.3 percent. This decline may reflect the Internal Revenue Service (IRS) program which verified social security numbers of all dependents claimed on tax returns in order to reduce fraudulent EIC claims. For taxpayers with one qualifying child, the number of returns claiming the EIC decreased 3.9 percent for 1994 while the amount of the credit increased 20.8 percent. For taxpayers with two or more qualifying children claiming the EIC, the number of

returns increased 1.6 percent, and the amount of the credit dramatically rose 45.5 percent. The increases for these returns may be related to the increased income eligibility level for taxpayers with two or more qualifying children, allowing more taxpayers to take advantage of the EIC. Similar changes can be seen in the statistics for the refundable portion of the credit.

Figure J shows a history of the EIC from 1985 through 1994. This program expanded greatly over this time period, with major increases (due to previous tax law changes) in 1987 and 1991. The tax law change for 1994 once again greatly increased the number of participants in this program and the amount of credit and refunds they received.

Individual Income Tax Returns, Preliminary Data, 1994

Figure J

Earned Income Credit (EIC), Tax Years 1985-1994

NOTE: Data for Tax Years 1985 and 1989 are final; data for all other years are preliminary.

Summary

Adjusted gross income and total positive income grew at over twice the rate for 1994 as they had for 1993, exceeding the rate of inflation by more than 2 percentage points. While income tax increased for this same period, for most income size classes used for the statistics, the average tax rates were the same as or lower than the rates for 1993. The two income size classes that did have a higher average tax rate for 1994 experienced only slight increases (0.1 or 0.2 percentage points) in their average tax rates. Total deductions increased only 2.1 percent, and taxable income rose 5.9 percent.

There were changes in law which affected several income and tax items for 1994. The total earned income credit increased 36.2 percent. The amount of social security benefits in AGI rose 57.0 percent. Moving expenses, while available to all taxpayers as a statutory adjustment, decreased as several expenses were no longer deductible. Other income items that showed substantial changes for 1994 include taxable distributions from IRA's

which increased 22.0 percent, partnership and S Corporation net income (less loss) which increased 19.3 percent, and unemployment compensation which declined 27.1 percent.

Definitions and Changes in Law

In general, the definitions used in this article are the same as those in *Statistics of Income—1993, Individual Income Tax Returns*. The following is a partial list of tax law and IRS administrative changes that had a major bearing on the 1994 preliminary data presented in this article.

Charitable Contributions Deduction. — Beginning in 1994, written acknowledgment from the qualified recipient organization was required for all charitable contributions of \$250 or more.

Earned Income Credit. — The earned income credit had several changes for 1994. The law determining who could claim the credit was modified to include certain taxpayers without qualifying children. Taxpayers between the ages of 25 and 64 who had earned income, had less than \$9,000

Individual Income Tax Returns, Preliminary Data, 1994

in both earned income and adjusted gross income, and did not have a qualifying child could claim the earned income credit. These taxpayers filled out the EIC Worksheet (instead of Schedule EIC) and claimed the credit on the Form 1040, Form 1040A, Form 1040EZ, or Form 1040PC return. For working taxpayers with qualifying children and claiming the earned income credit, both earned income and adjusted gross income had to be less than \$23,755 for one qualifying child or less than \$25,296 for two or more qualifying children. These taxpayers were required to attach the Schedule EIC to their Form 1040, Form 1040A, or Form 1040PC return.

The computation of the earned income credit was changed for 1994. The health insurance credit and the extra credit for a child born during the year were eliminated. For 1993, the health insurance credit could have been as much as \$465, and the extra credit could have been as much as \$388. In addition, for 1993 there was only a single earned income and adjusted gross income eligibility level of \$22,370 for all taxpayers, and the maximum basic credit amounts were \$1,434 for one qualifying child, and \$1,511 for two or more qualifying children. The credit for 1994 could have been as much as \$306 for taxpayers without children, \$2,038 for taxpayers with one qualifying child, and \$2,528 for taxpayers with two or more qualifying children.

Exemption Amount. — Indexing for inflation allowed a taxpayer to claim a \$2,450 deduction for each exemption to which he or she was entitled for 1994, a \$100 increase over the amount allowed for 1993. The threshold for the limitation of exemption amounts was also indexed for inflation, from \$108,450 to \$111,800 for single filers; \$162,700 to \$167,700 for married persons filing jointly and surviving spouses; \$135,600 to \$139,750 for heads of household; and \$81,350 to \$83,850 for married persons filing separately. After adjustment for inflation, the phaseout of the deduction for exemptions was completed at AGI levels above \$234,300 for single filers; \$290,200 for married persons filing jointly and surviving spouses; \$262,250 for heads of household; and \$145,100 for married persons filing separately. Above these levels, no deduction for exemptions was allowed.

Itemized Deductions. — If a taxpayer's AGI was greater than \$111,800 (\$55,900 if married filing separately), some types of his or her itemized deductions may have been limited; this threshold was increased from \$108,450 (\$54,225) for 1993, as a result of indexing for inflation. The limitation did not apply to deductions for medical and dental expenses, investment interest expenses, casualty or theft losses, and gambling losses; all other deductions were subject to the limitation. To arrive at allowable

itemized deductions, total itemized deductions were reduced by the smaller of: (a) 80 percent of the deductions that were subject to the limitation, or (b) 3 percent of AGI in excess of the limitation threshold.

Moving Expenses. — Beginning with 1994, current-year moving expenses were no longer an itemized deduction on Schedule A. Instead, taxpayers deducted current-year qualified moving expenses in the calculation of adjusted gross income as a statutory adjustment. This change allowed taxpayers who used the standard deduction to deduct their moving expenses. In order to deduct allowable moving expenses, the taxpayer's new job location had to be at least 50 miles farther from their former home than their old job location. Prior to 1994, the distance requirement was 35 miles. The following expenses were no longer deductible: meals while moving from the old residence to the new residence; travel expenses for pre-move house hunting trips; expenses while occupying temporary quarters in the area of the new job; and qualified residence sale, purchase, and lease expenses.

Self-employed Health Insurance Deduction. — The self-employed health insurance deduction expired on December 31, 1993. A bill was signed on April 11, 1995 restoring the provision retroactively to January 1, 1994. Taxpayers who had already filed their 1994 returns had to file an amended return if they wished to take advantage of the deduction. Amended returns, however, are not reflected in these statistics.

Self-employment Tax. — The ceilings on taxable "self-employment income" were changed for 1994. The maximum amount of net earnings subject to the social security part of self-employment tax increased to \$60,600. In contrast, all net earnings (without limit) greater than \$433 (\$108 for church employees) were subject to the Medicare tax portion. The limits for 1993 were \$57,600 for self-employment tax and \$135,000 for Medicare tax. (Self-employment taxes and Medicare taxes are reflected in the statistics for "total tax liability.") A deduction for one-half of self-employment tax was taken as an adjustment to income.

Social Security Benefits. — Beginning with 1994, certain taxpayers who received social security or equivalent "tier 1 railroad retirement benefits" had to include up to 85 percent of benefits received in their taxable income. By using a worksheet, taxpayers who had income in addition to any benefits received, calculated their "modified income" and compared it to both a base amount and an adjusted base amount [9]. If the "modified income" was between \$32,000 and \$44,000 for married taxpayers filing jointly, or \$25,000 and \$34,000 for all other taxpayers (except married taxpayers filing separately who lived

Individual Income Tax Returns, Preliminary Data, 1994

with their spouse anytime during the year and had a base amount of zero), 50 percent of the income over the base, but not more than 50 percent of the benefits received, was taxable. However, if the "modified income" exceeded the adjusted base amount of \$44,000 for married taxpayers filing jointly, or \$34,000 for all other taxpayers (except married taxpayers filing separately who lived with their spouse anytime during the year and had an adjusted base amount of zero), \$4,500 (\$6,000, if married filing jointly) plus 85 percent of the income above the \$34,000 or \$44,000 threshold would be taxable, with the taxable amount limited to 85 percent of social security benefits. If the "modified income" amount was less than the base amount, none of the benefits received were taxable. Prior to 1994, a maximum of 50 percent of social security or tier 1 railroad retirement benefits was included in adjusted gross income.

Standard Deduction. — The basic standard deduction and additional standard deduction for age or blindness increased for 1994 as a result of inflation indexing. For single filers, the basic standard deduction rose from \$3,700 to \$3,800; for married persons filing jointly or surviving spouses, from \$6,200 to \$6,350; for married persons filing separately, from \$3,100 to \$3,175; and for heads of household, from \$5,450 to \$5,600. The additional standard deduction for taxpayers, age 65 or older or the blind rose from \$900 to \$950 for single filers and heads of households, and from \$700 to \$750 for married persons filing jointly, surviving spouses, and married persons filing separately.

Tax Brackets. — To counterbalance the effects of inflation, the boundaries for the 15 percent and 28 percent tax brackets were widened. The 15 percent bracket applied to taxable income equal to or below \$22,750 for single filers; \$38,000 for joint filers or surviving spouses; \$19,000 for married persons filing separately; and \$30,500 for heads of household. The 28 percent tax bracket applied to taxable income in excess of the 15 percent bracket ceiling and equal to or below \$55,100 for single filers; \$91,850 for joint filers or surviving spouses; \$45,925 for married persons filing separately; and \$78,700 for heads of household. The 31 percent tax bracket applied to taxable income in excess of the 28 percent bracket ceiling and equal to or below \$115,000 for single filers; \$140,000 for joint filers or surviving spouses; \$70,000 for married persons filing separately; and \$127,500 for heads of households. The 36 percent tax bracket applied to taxable income in excess of the 31 percent bracket ceiling and equal to or below \$250,000 for single filers, joint filers or surviving spouses, and heads of

households, and \$125,000 for married persons filing separately. The 39.6 percent tax rate applied to taxable income in excess of the upper boundary for the 36 percent tax bracket.

Data Sources and Limitations

These preliminary statistics are based on a sample of individual income tax returns (Forms 1040, 1040A, 1040EZ, and 1040PC, including electronically-filed returns) filed during Calendar Year 1995. Returns in the sample were stratified based on: (a) the larger of positive income or negative income; (b) the size of business and farm receipts; (c) the presence or absence of specific forms or schedules; and (d) the usefulness of returns for tax policy modeling purposes [10]. Returns were then selected at rates ranging from 0.02 percent to 100 percent. The preliminary 1994 data are based on a sample of 91,044 returns and an estimated final population of 116,976,544 returns. The corresponding sample and population for the preliminary 1993 data were 88,191 and 115,616,004 returns, respectively.

Since the data presented here are estimates based on a sample of returns filed, they are subject to sampling error. To properly use the statistical data provided, the magnitude of the potential sampling error must be known; coefficients of variation (CV's) are used to measure that magnitude. Estimated CV's for the number of returns and money amounts for selected income items are presented in Figure K. The reliability of estimates based on samples, and the use of coefficients of variation for evaluating the precision of estimates based on samples, are discussed in the appendix to this issue of the *Bulletin*.

While the preliminary estimates are intended to represent a full year of taxpayer reporting, they are actually based on returns processed for tax administration purposes, in the case of 1994 returns, between January and late September of 1995. In general, returns processed during the remainder of each year tend to have somewhat different characteristics compared to the returns processed earlier. These characteristics include disproportionately large amounts of investment income, passive losses, and alternative minimum tax, for example.

All comparisons between 1994 and 1993 are based on preliminary estimates for each year. A comparison of 1993 preliminary and final data is provided in Figure L. Items such as AGI, salaries and wages, and total income tax, which are reported on most returns, changed little. In contrast, other items, including partnership and S Corporation net loss, "other" income less loss, and the alternative minimum tax tend to be understated, to varying degrees, in all preliminary estimates.

Notes and References

[1] *Economic Report of the President, 1995*, p. 341. The consumer price index (CPI-U) represents annual averages of monthly figures and reflects buying patterns of all urban consumers (1982-84=100):

1994 CPI-U = 148.2
 1993 CPI-U = 144.5;
 1992 CPI-U = 140.3.

[2] "Preliminary estimates" differ from the "early tax estimates" published for 1994 in the Fall 1995 edition of the *Bulletin*. The preliminary estimates in this article represent estimated totals expected for the full tax year, based on returns processed by the Internal Revenue Service through September 1995. The early tax estimates represent data only for returns filed through April 28.

[3] For more information on the growth rates of AGI and taxable income for 1993, see Cruciano, Therese M., "Individual Income Tax Returns, Preliminary Data, 1993," *Statistics of Income Bulletin*, Spring 1995, Volume 14, Number 4.

[4] Average AGI is defined as the amount of AGI divided by the number of returns filed. Average taxable income is defined as the amount of taxable income divided by the number of returns with taxable income. Average total income tax is defined as the amount of total income tax divided by the number of taxable returns. Taxable returns are defined as returns with "total income tax" (the sum of income tax after credits and the alternative minimum tax) present.

[6] *Economic Report of the President, 1995*, p. 320.

[7] For purposes of this article, total positive income is a compilation of all income items on individual income tax returns (Forms 1040, 1040A, 1040EZ, 1040PC, and electronically-filed returns) for which a positive amount was reported by the taxpayer. The Form 1040 income tax return entry for Schedule E, *Supplemental Income and Loss* (From rental real estate, royalties, partnerships, S corporations, estates, trusts, REMICs, etc.), was separated into the following components: rent and royalty net income, partnership and S Corporation net income, and estate and trust net income. When any of these components were positive on a return, the corresponding income (rather than the netted total amount from Schedule E) was included in the statistics for total positive income. For example, if a return showed estate and trust net income of \$20,000 and rent and royalty net loss of \$12,000, total positive income would include the \$20,000 of estate and trust net income, rather than the \$8,000 netted total of both sources of supplemental income.

[8] For example, farm net income decreased 10.3 percent, from \$9.7 billion to \$8.7 billion, while farm net loss

rose 20.4 percent, from \$12.8 billion to \$15.4 billion. The net income (less loss), however, decreased 117.5 percent. The smaller percentage changes in the positive and negative portions led to a larger percentage change in the combined total because the respective portions of total income and total losses were similar in size.

[9] In contrast to AGI, modified income (calculated on the social security worksheet) includes tax-exempt interest, excludable interest from U.S. savings bonds reported on Form 8815, one-half of total social security benefits, and the foreign-earned income exclusion, and excludes the foreign housing deduction.

[10] Returns in the sample were stratified based on the presence or absence of one or more of the following forms or schedules: Form 2555, *Foreign Earned Income*; Form 1116, *Foreign Tax Credit (Individual, Fiduciary, or Nonresident Alien Individual)*; Schedule C, *Profit or Loss from Business (Sole Proprietorship)*; Schedule F, *Profit or Loss From Farming*; and Form 4835, *Farm Rental Income and Expenses (Crop and Livestock Shares (Not Cash) Received by Landowner (or Sub-Lessor))*.

Individual Income Tax Returns, Preliminary Data, 1994

Table 1.—All Returns: Selected Income, Adjustments, Deductions, and Tax Items, by Size of Adjusted Gross Income

(All figures are estimates based on samples—money amounts are in thousands of dollars)

Nontaxable returns.....	-	-	-	-	-	-	2,145,861	1,795,584

¹Estimate should be used with caution because of the small number of sample returns on which it is based.

²Not included in adjusted gross income.

³Total income tax represents income tax after credits (including the earned income credit), plus alternative minimum tax.

⁴Total tax liability represents income tax after credits (including the earned income credit), plus alternative minimum tax, plus any other additional taxes, e.g., self-employment tax and penalty tax on Individual Retirement Arrangements (IRA's).

NOTE: Detail may not add to totals because of rounding.

Individual Income Tax Returns, Preliminary Data, 1994

Table 2.--Returns With Earned Income Credit by Size of Adjusted Gross Income

[All figures are estimates based on samples--money amounts are in thousands of dollars]
